FEATURES

Two Output Voltages: 5.0 V, 3.3 V
Output Current: 2 A
Input voltage: 8.0-16.0 V
Ripple 2% ppk of Output Voltage
Transient step ±5%, 50% max load

ADP1829 DESCRIPTION

This ADP1829 reference design uses 8.0 V to 16.0 V for the input voltage. The output voltages and currents are as follows:

- \( V_{OUT1} = 5.0 \text{ V} \) with a maximum output current of 2.0 A,
- \( V_{OUT2} = 3.3 \text{ V} \) with a maximum output current of 2.0 A.

Design criteria require no tracking or sequencing. The ripple and transient assumptions are 2% peak to peak voltage ripple (for the switchers) and 5% deviation due to 50% instantaneous load step respectively. The nominal switching frequency is fixed at 300 kHz.

REVISION HISTORY

11/1/2007—Revision 0: Initial Version
GENERAL DESCRIPTION

ADP1829

The ADP1829 is a versatile, dual output, interleaved, synchronous PWM buck controller that generates two independent outputs from an input voltage of 2.9 V to 18 V. Each channel can be configured to provide output voltage from 0.6 V to 85% of the input voltage. The two channels operate 180° out of phase, which reduces the current stress on the input capacitor and allows the use of a smaller and lower cost input capacitor.

The ADP1829 operates at a pin-selectable fixed switching frequency of either 300 kHz or 600 kHz. For some noise sensitive applications, it can also be synchronized to an external clock to achieve switching frequency between 300 kHz and 1 MHz. The switching frequency chosen is 300 kHz to get good efficiency over a wide range of input and output conditions.

The ADP1829 includes an adjustable soft start to limit input inrush current, voltage tracking for sequencing or DDR termination, independent power-good output, and a power enable pin. It also provides current-limit and short-circuit protection by sensing the voltage on the synchronous MOSFET.

ASSEMBLY DRAWING

Figure 3. Top Assembly Drawing for 1829 Evaluation Board

Figure 4. Bottom Assembly Drawing for 1829 Evaluation Board (looking through from top)
POWERING THE ADP1829

The ADP1829 is supplied fully assembled.

INPUT POWER SOURCE

1. Before connecting the power source to the ADP1829, make sure that it is turned off. If the input power source includes a current meter, use that meter to monitor the input current.

2. Connect the positive terminal of the power source to the VIN terminal on the evaluation board, and the negative terminal of the power source to the GND terminal just below the VIN terminal.

3. If the power source does not include a current meter, connect a current meter in series with the input source voltage.

4. Connect the positive lead (+) of the power source to the ammeter positive (+) connection, the negative lead (−) of the power source to the GND pins on the board, and the negative lead (−) of the ammeter to the VIN pins on the board.

OUTPUT LOAD

1. Although the ADP1829 can sustain the sudden connection of the load, it is possible to damage the load if it is not properly connected.

2. Make sure that the board is turned off before connecting the load.

   a) If the load includes an ammeter, or if the current is not measured, connect the load directly to the evaluation board with the positive (+) load connection to the V_{OUT} pins and negative (−) load connection to the GND pins next to the V_{OUT} pins.

   b) If an ammeter is used, connect it in series with the load; connect the positive (+) ammeter terminal to the evaluation board V_{OUT} pins, the negative (−) ammeter terminal to the positive (+) load terminal, and the negative (−) load terminal to the evaluation board GND pins next to the V_{OUT} pins.

   c) Repeat for the other V_{OUT} channel.

Once the loads are connected, make sure that they are set to the proper current before powering the ADP1829.

INPUT AND OUTPUT VOLTMETERS

Measure the input and output voltages with voltmeters.

1. Connect the voltmeter measuring the input voltage with the positive (+) lead connected to the VIN pins on the test board and the negative lead (−) connected to the GND test point between the inductors (TP13 or TP21).

2. Connect the voltmeter measuring V_{OUT1} with the positive lead (+) connected to the test point near the V_{OUT1} pins (TP9) and the negative lead (−) connected to the adjacent GND test point (TP13).

3. Connect the voltmeter measuring V_{OUT2} in the same manner (between TP8 and TP21).

4. Make sure to connect the voltmeters to the appropriate evaluation board test points and not to the load or power source themselves.

5. If the voltmeters are not connected directly to the evaluation board at these connection points, the measured voltages will be incorrect due to the voltage drop across the leads connecting the evaluation board to both the source and load.
TURNING ON THE EVALUATION BOARD

Once the power source and loads are connected to the ADP1829, the board can be powered for operation. Slowly increase the input power source voltage until the input voltage exceeds the minimum input operating voltage of 8.0 V. If the load is not already enabled, enable the load and check that it is drawing the proper current and that the output voltage maintains voltage regulation.
