GENERAL DESCRIPTION

The HMC606LC5 is a gallium arsenide (GaAs), indium gallium phosphide (InGaP), heterojunction bipolar transistor (HBT), monolithic microwave integrated circuit (MMIC) distributed amplifier housed in a 32-terminal, ceramic, leadless chip carrier (LCC) package that operates from 2 GHz to 18 GHz. With an input signal of 12 GHz, the amplifier provides ultralow phase noise performance of −160 dBc/Hz at a 10 kHz offset, representing a significant improvement over field effect transistor (FET)-based distributed amplifiers.

The HMC606LC5 provides 13.5 dB of small signal gain, 27 dBm output IP3, and 15 dBm of output power for 1 dB compression while requiring 64 mA from a 5.0 V supply. The input and output of the HMC606LC5 amplifier are internally matched to 50 Ω and are internally dc blocked.

APPLICATIONS INFORMATION

EVALUATION PRINTED CIRCUIT BOARD (PCB)

The circuit board used in the application must use RF circuit design techniques. Signal lines must have 50 Ω impedance, and the package ground leads and package bottom must be connected directly to the ground plane similar to that shown in Figure 20.

Use a sufficient number of via holes to connect the top and bottom ground planes. Mount the evaluation PCB to an appropriate heat sink. The evaluation PCB shown in Figure 20 is available from Analog Devices, Inc., upon request.
