

High Linearity, Silicon SP4T Switch, 30 MHz to 6 GHz

FEATURES

- ▶ Frequency range : 30 MHz to 6 GHz
- ▶ Reflective design
- ▶ Low Insertion Loss
 - ▶ 0.30 dB to 1.0 GHz typical
 - ▶ 0.35 dB to 2.8 GHz typical
 - ▶ 0.40 dB to 3.8 GHz typical
 - ▶ 0.45 dB to 5.0 GHz typical
 - ▶ 0.60 dB to 6.0 GHz typical
- ▶ High power handling at $T_{CASE} = 105^{\circ}C$
 - ▶ Long-term (>10 years) average
 - ▶ Continuous wave power: 39 dBm
 - ▶ LTE signal
 - ▶ Average power: 39 dBm
 - ▶ Peak power: 49 dBm
- ▶ High input linearity, IP3: 84 dBm typical
- ▶ ESD ratings
 - ▶ HBM: 2000 V, Class 2
 - ▶ CDM: 1000 V, Class C3
- ▶ Single-supply operation, integrated NVG
- ▶ Positive control, LVCMOS-/LVTTTL- compatible
- ▶ 4 mm x 4 mm, 22-terminal LGA package

APPLICATIONS

- ▶ 5G antenna tilting
- ▶ Wireless infrastructure
- ▶ Military and high reliability applications
- ▶ Test equipment
- ▶ Pin diode replacement

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

GENERAL DESCRIPTION

The ADRF5345 is a high linearity, reflective, single-pole, four-throw (SP4T) switch manufactured in the silicon process.

The ADRF5345 operates from 30 MHz to 6 GHz with a typical insertion loss lower than 0.40 dB up to 3.8 GHz, and a typical input IP3 of 84 dBm. The device has an RF input power handling capability of 39 dBm for continuous wave signals and 39 dBm average and 49 dBm peak for long-term evolution (LTE) signals.

The ADRF5345 incorporates an integrated negative voltage generator (NVG) to operate with a single positive supply of 5 V (V_{DD}) applied to the VDD pin drawing a 2 mA supply current. The device employs low voltage complementary metal-oxide semiconductor (LVCMOS)-/low voltage transistor to transistor logic (LVTTTL)- compatible controls.

The ADRF5345 comes in a 4 mm × 4 mm, 22-terminal, RoHS-compliant, land grid array (LGA) package and operates between $-40^{\circ}C$ to $+105^{\circ}C$.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
V_{DD}	-0.3 V to +5.5 V
V_{CTL}	-0.3 V to +3.6 V
RF Input Power ^{1,2} ($V_{DD} = 5.0$ V, $f = 0.1$ GHz to 3.8 GHz, $T_{CASE} = 105^{\circ}\text{C}$)	
Average	42.5 dBm
Peak	52.5 dBm
RF Input Power, ² Unbiased ($f = 0.1$ GHz to 3.8 GHz, $T_{CASE} = 105^{\circ}\text{C}$)	
Average	39 dBm
Peak	49 dBm
Temperature	
Junction	135°C
Storage	-65°C to +150°C
Reflow	260°C

¹ For recommended operating conditions, see Table 1.

² For power derating over frequency, see Figure 2 and Figure 3.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θ_{JC} is the junction to case bottom (channel to package bottom) thermal resistance.

Table 3. Thermal Resistance

Package Type	θ_{JC} ¹	Unit
CC-22-2	37	°C/W

¹ θ_{JC} was determined by simulation under the following conditions: the heat transfer is due solely to the thermal conduction from the channel through the ground pad to the PCB, and the ground pad is held constant at the operating temperature of 105°C.

POWER DERATING CURVES

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 4. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 2, 4 to 6, 8, 9, 17, 19, 20, 22	GND	Ground.
3	RFC	RF Common Port. The RFC pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is required when the RF line potential is equal to 0 V dc.
7	RF4	RF Throw Port 4. The RF4 pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is required when the RF line potential is equal to 0 V dc.
10	RF3	RF Throw Port 3. The RF3 pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is required when the RF line potential is equal to 0 V dc.
12	TEST	Factory Test Pin. The TEST pin must be tied to ground.
13	LS	Logic Select. See Table 6.
14	V2	Control Input 2. See Table 6.
15	V1	Control Input 1. See Table 6.
16	VDD	Positive Supply Voltage.
18	RF2	RF Throw Port 2. The RF2 pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is required when the RF line potential is equal to 0 V dc.
21	RF1	RF Throw Port 1. The RF1 pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is required when the RF line potential is equal to 0 V dc.
	EPAD	Exposed Pad. The exposed pad must be connected to the RF and dc ground of the PCB.

THEORY OF OPERATION

The ADRF5345 integrates a NVG and requires a single, positive supply voltage applied to the VDD pin. Bypass capacitors are recommended on the supply and control lines to minimize RF coupling.

All of the RF ports (RFC and RF1 to RF4) are dc-coupled to 0 V, and no dc blocking is required at the RF ports when the RF line potential is equal to 0 V. The RF ports are internally matched to 50 Ω . Therefore, external matching networks are not required.

The ADRF5345 integrates a driver to perform logic functions internally and to provide the user with the advantage of a simplified LVCMOS-/LVTTTL-compatible control interface. The driver features three digital control input pins (LS, V1, and V2) that control the state of the RFx paths. See [Table 6](#).

The logic select (LS) input allows the user to define the control input logic sequence for the RF path selections. The logic levels applied to the V1 and V2 pins determine which RFx port is in the insertion loss state while the other three paths are in the isolation state.

The insertion loss path conducts the RF signal between the selected RF throw port and the RF common port. The switch design is

bidirectional with equal power handling. The RF input signal can be applied to the RFC port or the selected RF throw port. The isolation paths provide high loss between the insertion loss path and the unselected RF throw ports.

The ideal power-up sequence is as follows:

1. Connect GND.
2. Power up VDD.
3. Apply the digital control inputs: LS, V1, and V2. Applying digital control inputs before the VDD supply can inadvertently forward bias and damage the internal ESD protection structures. A series 1 k Ω resistor can be used to limit the current flowing into the control pin in such cases. If the control pins are not driven to a valid logic state (that is, controller output is in high impedance state) after VDD is powered up, it is recommended to use pull-up and power-down resistors.
4. Apply an RF input signal.

The ideal power-down sequence is the reverse order of the power-up sequence.

Table 6. Control Voltage Truth Table

Digital Control Inputs			RFx Paths			
LS	V1	V2	RF1 to RFC	RF2 to RFC	RF3 to RFC	RF4 to RFC
Low	Low	Low	Insertion loss (on)	Isolation (off)	Isolation (off)	Isolation (off)
Low	High	Low	Isolation (off)	Insertion loss (on)	Isolation (off)	Isolation (off)
Low	Low	High	Isolation (off)	Isolation (off)	Insertion loss (on)	Isolation (off)
Low	High	High	Isolation (off)	Isolation (off)	Isolation (off)	Insertion loss (on)
High	Low	Low	Isolation (off)	Isolation (off)	Isolation (off)	Insertion loss (on)
High	High	Low	Isolation (off)	Isolation (off)	Insertion loss (on)	Isolation (off)
High	Low	High	Isolation (off)	Insertion loss (on)	Isolation (off)	Isolation (off)
High	High	High	Insertion loss (on)	Isolation (off)	Isolation (off)	Isolation (off)

APPLICATION INFORMATION

TYPICAL APPLICATION EXAMPLES

Connect the RF ports of the ADRF5345 to transmission lines with a characteristic impedance of 50 Ω . The package ground leads and the backside ground slug must connect directly to the ground plane.

The ADRF5345 has one power supply pin (VDD) and three control pins (V1, V2, and LS). The supply pin must be decoupled with 100 pF and 4.7 μ F capacitors, while the control pins must be decoupled with 100 pF capacitors.

A typical application of ADRF5345 is a 4 step phase shifter that is achieved by connecting the SP4T switches back to back. Each RF arm must have a different delay line (see Figure 26).

The switch control inputs, V1 and V2, can be connected together to configure the back to back phase shifter, which is achieved by applying inverted logic to LS pin of SW1 and SW2. The LS pins do not require additional routing due to the internal pull-up. Therefore, the LS pin of ADRF5345 can be directly grounded or only decoupled with a capacitor.
