

General Description

The MAX96717R GMSL™ serializer receives video on a 4-lane MIPI CSI-2 interface and outputs it on a GMSL2 serial link transceiver for transport over a coaxial cable. Simultaneously, it sends and receives bidirectional control channel data across the same GMSL2 link. The GMSL2 link operates at a fixed rate of 3Gbps in the forward direction and 187.5Mbps in the reverse direction. The device is programmed through a local I²C interface or across the link from a matching deserializer. The MAX96717R features flexible GPIO tunnels and register-programmed GPIO. Operation is specified over the automotive temperature range of -40°C to +105°C. The device is AEC-Q100 grade 2 qualified.

Data can be transported over low-cost 50Ω coax cables that meet the GMSL2 channel specification. [Table 1](#) provides guidance to typical maximum lengths of commonly used automotive cables. Contact the factory for the GMSL2 Channel Specification.

Table 1. Typical Maximum Cable Length vs. Attenuation

	3.2mm Ø 50Ω Coax, Foam Dielectric	2.7mm Ø 50Ω Coax, Solid Dielectric
Attenuation at 3GHz (Typ, Room Temp)	0.9dB/m	1.6dB/m
Attenuation at 3GHz (Max, Aged, +105°C)	1.1dB/m	2.0dB/m
GMSL Fwd/Rev Data Rate	Typical Maximum Cable Length at +105°C	
3Gbps/187.5Mbps	20m	10m

Applications

- Advanced Driver Assistance Systems (ADAS)
- Surround View Systems (SVS)
- Driver Monitor Systems (DMS)
- Rear View Camera (RVC)
- Systems with Multiple Synchronized Cameras

Benefits and Features

- Automotive-Grade High-Speed Link
 - Supports 19dB Insertion Loss at 1.5GHz
 - Auto Adapt for Changes in Channel Conditions
 - Operates -40°C to +105°C Ambient
- Four-Lane MIPI CSI-2 v1.3 Input Port
 - MIPI D-PHY v1.2 Rated at 600Mbps/Lane
 - Polarity Flip and Data-Lane Reassignment
 - Supports 4 Virtual Channels
- Single GMSL2 Output
 - 3Gbps in GMSL2 Forward Link-Rate
 - 187.5Mbps Reverse Link-Rate
- Bidirectional Control Channel Supports
 - Seven Configurable GPIO
 - 1 x I²C Port, up to 1MHz
- Reduce BOM and Space Savings
 - Tiny, 5mm x 5mm TQFN
 - Industry's Smallest Power over Coax (PoC)

Absolute Maximum Ratings

(All voltages with respect to ground)	-0.3V to +2.0V	D_P/N, CKP/N	-0.3V to +1.35V
V _{DD18}	-0.3V to +2.0V	XRES, X2	-0.3V to (V _{DD18} + 0.3V)
V _{DD}	-0.3V to +2.0V	All Other Pins	-0.3V to (V _{DD18} + 0.3V)
CAP_VDD	-0.3V to +1.2V	Storage Temperature Range	-40°C to +150°C
SIO_(Active State) (Note A)	-0.3V to (CAP_VDD + 0.3V)	Soldering Temperature (Reflow)	+260°C
SIO_(Inactive State) (Note A)	-0.3V to (CAP_VDD + 0.3V)		

Note A: Active state means the device is powered-up and not in a power-down mode. Inactive means the device is not powered-up or powered-up in power-down mode.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

32 TQFN

Package Code	T3255+8
Outline Number	21-0140
Land Pattern Number	90-0013
Thermal Resistance, Four-Layer Board	
Junction to Ambient (θ _{JA})	29°C/W
Junction to Case (θ _{JC})	1.7°C/W

For the latest package outline information and land patterns (footprints), go to [www.analog.com/packages](#). Note that a “+”, “#”, or “-” in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board in still air. For detailed information on package thermal considerations, refer to [www.analog.com/thermal-tutorial](#).

Electrical Characteristics

($V_{DD18} = 1.7V$ to $1.9V$, $V_{DD} = 0.95V$ to $1.26V$, $T_A = -40^\circ C$ to $+105^\circ C$, EP connected to PCB ground, typical values are at $V_{DD18} = 1.8V$, $V_{DD} = 1.0V$, $T_A = +25^\circ C$, unless otherwise noted. ([Note 1](#)))

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
DC ELECTRICAL CHARACTERISTICS / GMSL2 FORWARD-CHANNEL SERIAL INPUTS/OUTPUTS (SIOP, SION)—SEE Figure 1						
Output-Voltage Swing (Single-Ended)	V_O	$R_L = 100\Omega \pm 1\%$, $(V_{OH} - V_{OL})$ for both outputs	300	400	500	mV
Differential Output Offset Voltage	V_{OS}	$R_L = 100\Omega \pm 1\%$, offset voltage in each output state	0.4	0.5	0.6	V
Termination Resistance (Internal)	R_O	Any pin to V_{DD18}	45	50	55	Ω
DC ELECTRICAL CHARACTERISTICS / D-PHY HS RECEIVER						
Common-Mode Voltage HS Receive Mode	$V_{CMRX(DC)}$		70	330		mV
Differential Input High Threshold	V_{IDTH}			40		mV
Differential Input Low Threshold	V_{IDTL}		-40			mV
Single-Ended Input High Voltage	V_{IHHS}			460		mV
Single-Ended Input Low Voltage	V_{ILHS}		-40			mV
Single-Ended Threshold for HS Termination Enable	$V_{TERM-EN}$			450		mV
Differential Input Impedance	Z_{ID}		80	100	125	Ω
DC ELECTRICAL CHARACTERISTICS / I/O PINS (GPIO)						
High-Level Input Voltage	V_{IH}		$0.7 \times V_{DD18}$			V
Low-Level Input Voltage	V_{IL}			$0.3 \times V_{DD18}$		V
High-Level Output Voltage	V_{OH}	$I_{OH} = -4mA$	$V_{DD18} - 0.4$			V
Low-Level Output Voltage	V_{OL}	$I_{OL} = 4mA$		0.4		V
Input Current	I_{IN}	$V_{IN} = 0$ to V_{DD18} . All pullup/pulldown devices disabled.		1		μA
Input Capacitance	C_{IN}	Each pin		5		pF
Input Pullup/Pulldown Resistance	R_{IN}	40k Ω enabled		40		k Ω
		1M Ω enabled		1		M Ω
DC ELECTRICAL CHARACTERISTICS / OPEN-DRAIN PINS						
High-Level Input Voltage	V_{IH2}		$0.7 \times V_{DD18}$			V
Low-Level Input Voltage	V_{IL2}			$0.3 \times V_{DD18}$		V

Electrical Characteristics (continued)

($V_{DD18} = 1.7V$ to $1.9V$, $V_{DD} = 0.95V$ to $1.26V$, $T_A = -40^\circ C$ to $+105^\circ C$, EP connected to PCB ground, typical values are at $V_{DD18} = 1.8V$, $V_{DD} = 1.0V$, $T_A = +25^\circ C$, unless otherwise noted. ([Note 1](#)))

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Low-Level Open-Drain Output Voltage	V_{OL}	$I_{OL} = 4mA$			0.4	V
Input Current	I_{IN}	$V_{IN} = 0$ to V_{DD18} . All pullup/pulldown devices disabled.			1	μA
Input Capacitance	C_{IN}	Each pin		3		pF
Internal Pullup Resistor	R_{PU}	40k Ω enabled		40		k Ω
		1M Ω enabled		1		M Ω
DC ELECTRICAL CHARACTERISTICS / PWDNB INPUT						
High-Level Input Voltage	V_{IH}		$0.7 \times V_{DD18}$			V
Low-Level Input Voltage	V_{IL}			$0.3 \times V_{DD18}$		V
Input Current	I_{IN}	$V_{IN} = 0$ to V_{DD18}		6		μA
Input Capacitance	C_{IN}			3		pF
Internal Pulldown Resistor	R_{PD}			1		M Ω
DC ELECTRICAL CHARACTERISTICS / PUSH-PULL OUTPUTS (GPIO)						
High-Level Output Voltage	V_{OH}	$I_{OH} = -4mA$	$V_{DD18} - 0.4$			V
Low-Level Output Voltage	V_{OL}	$I_{OL} = 4mA$		0.4		V
DC ELECTRICAL CHARACTERISTICS / REFERENCE CLOCK INPUT (CRYSTAL) (X1, X2)						
X1 Input Capacitance	C_{IN_X1}			3		pF
X2 Input Capacitance	C_{IN_X2}			1		pF
Internal X2 Limit Resistor	R_{LIM}			1.2		k Ω
Internal Feedback Resistor	R_{FB}			10		k Ω
Transconductance	g_m			28		mA/V
DC ELECTRICAL CHARACTERISTICS / POWER SUPPLY CURRENTS						
Supply Current (Note 3)	I_{DD}	RGB888, 3Gbps, 4-lane CSI-2 input, 600Mbps per lane	$V_{DD18} = 1.9V$	46	53	mA
			$V_{DD} = 1.05V$	74	228	
			$V_{DD} = 1.26V$	74	238	
DC ELECTRICAL CHARACTERISTICS / POWER-DOWN CURRENT						
Maximum Power-Down Current	I_{DD}	V_{DD18} at 1.9V	$T_A = +25^\circ C$	10		μA
			$T_A = +105^\circ C$	10		
		V_{DD} at 1.26V	$T_A = +25^\circ C$	3		
			$T_A = +105^\circ C$	48		
AC ELECTRICAL CHARACTERISTICS / FORWARD CHANNEL SWITCHING CHARACTERISTICS						
Serial-Output Rise Time	t_R	20% to 80%, $V_{OD} = 800mV$ differential, $R_L = 100\Omega$, 500mV single-ended $R_L = 50\Omega$		50		ps

Electrical Characteristics (continued)

($V_{DD18} = 1.7V$ to $1.9V$, $V_{DD} = 0.95V$ to $1.26V$, $T_A = -40^\circ C$ to $+105^\circ C$, EP connected to PCB ground, typical values are at $V_{DD18} = 1.8V$, $V_{DD} = 1.0V$, $T_A = +25^\circ C$, unless otherwise noted. ([Note 1](#)))

PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNITS
Serial-Output Fall Time	t_F	80% to 20%, $V_{OD} = 800mV$ differential, $R_L = 100\Omega$, 400mV single-ended $R_L = 50\Omega$			50		ps
Total Serial-Output Jitter	t_{TSOJ}	PRBS7, single-ended or differential			0.15		UI (p-p)
Deterministic Serial-Output Jitter	t_{DSOJ}	PRBS7, single-ended or differential			0.10		UI (p-p)
Lock Time	t_{LOCK}	Time from deassertion of PWDNB until $LOCK = '1'$. See Figure 17			45		ms
Maximum Video Latency	t_{VL}	Time from CSI-2 input to SIO \pm output in GMSL2 packet. See Figure 4 .	Pixel mode		$120 \times t_{PCLK}$		s
			Tunneling mode 3G		$30 \times t_{PCLK} + 2\mu s$		
PWDNB Hold Time	t_{HOLD_PWDNB}	The minimum duration PWDNB must be held LOW to reset the device.			1		ms
GPI-to-GPO Delay	t_{GPD1}	Delay compensated mode.			10		μs
	t_{GPD2}	Non-delay compensated mode.			3		
GPI-GPO Skew Reverse Path	t_{SKEW}	Delay compensated mode.			7		ns

AC ELECTRICAL CHARACTERISTICS / D-PHY HS RECEIVER

Common-Mode Interference Beyond 450MHz	$\Delta V_{CMRX(HF)}$	Note 2 , Note 5 , Note 7	Data rate > 1.5Gbps		50	mV
Common-Mode Interference 50MHz–450MHz	$\Delta V_{CMRX(LF)}$	Note 2 , Note 5 , Note 6	Data rate > 1.5Gbps	-25	25	mV
Common-Mode Reflection Coefficient	S_{ccRX}	450MHz < $f < 1.875\text{GHz}$			-5	dB
Differential-Mode Reflection Coefficient	S_{ddRX}	$f < 20\text{MHz}$			-22.5	dB
		$f = 1.25\text{GHz}$			-12	
		$f = 1.875\text{GHz}$			-9.7	

AC ELECTRICAL CHARACTERISTICS / D-PHY LP RECEIVER—SEE [Figure 5 \(Note 2\)](#)

Input Pulse Rejection	e_{SPIKE}	See Figure 5		300	V*ps
Minimum Pulse Width Response	t_{MIN-RX}	See Figure 5		20	ns
Peak Interference Amplitude	V_{INT}			200	mV
Interference Frequency	f_{INT}			450	MHz

AC ELECTRICAL CHARACTERISTICS / D-PHY DATA CLOCK TIMING—SEE [Figure 6 \(Note 2\)](#)

UI Variation	ΔUI	UI $\geq 1\text{ns}$, within a single burst	-10%	+10%	UI
		0.667ns < UI < 1ns, within a single burst	-5%	5%	
Data to Clock Setup Time	$t_{SETUP[RX]}$	< 1.0Gbps	0.15		UI _{INST}
		> 1.0Gbps	0.2		

Electrical Characteristics (continued)

($V_{DD18} = 1.7V$ to $1.9V$, $V_{DD} = 0.95V$ to $1.26V$, $T_A = -40^\circ C$ to $+105^\circ C$, EP connected to PCB ground, typical values are at $V_{DD18} = 1.8V$, $V_{DD} = 1.0V$, $T_A = +25^\circ C$, unless otherwise noted. ([Note 1](#)))

Electrical Characteristics (continued)

($V_{DD18} = 1.7V$ to $1.9V$, $V_{DD} = 0.95V$ to $1.26V$, $T_A = -40^\circ C$ to $+105^\circ C$, EP connected to PCB ground, typical values are at $V_{DD18} = 1.8V$, $V_{DD} = 1.0V$, $T_A = +25^\circ C$, unless otherwise noted. ([Note 1](#)))

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Rise Time	t_R	20% to 80%, $C_L = 10pF$, 12.5MHz (25MHz divided by 2), (Note 4)		2		ns
Fall Time	t_F	80% to 20%, $C_L = 10pF$, 12.5MHz (25MHz divided by 2), (Note 4)		2		ns
Jitter	t_J	$C_L = 10pF$, Rising or falling edge, 12.5MHz (25MHz divided by 2)		100		ps (p-p)

Note 1: Limits are 100% tested at $T_A = +105^\circ C$. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization.

Note 2: Not production tested. Guaranteed by design and characterization.

Note 3: Color bar pattern. Maximum supply currents are measured at indicated supply voltages. Typical supply currents are measured at the typical supply voltages.

Note 4: MFP pin speed programmed to fastest setting. See the [Multifunction Pin Assignments](#) section.

Note 5: Excluding static ground shift of 50mV.

Note 6: Voltage difference compared to the DC average common-point potential.

Note 7: $\Delta V_{CMRX(HF)}$ is the peak amplitude of a sine wave superimposed on the receiver inputs.

Typical Operating Characteristics

($V_{DD18} = 1.8V$, $V_{DD} = 1.0V$, $T_A = +25^\circ C$ unless otherwise noted. 3Gbps forward rate, 187.5Mbps reverse rate, PRBS24 data, 600Mbps per lane on 4 lanes DPHY.)

Pin Configuration

Pin Descriptions

PIN	NAME	FUNCTION MODE	FUNCTION
		GMSL2	
GMSL2 SERIAL LINK			
12	SIOP	SIOP	Coax Serial-Data Input/Output.
13	SION	SION	Inverted Serial-Data Input/Output. Terminate with 100nF in series with 50Ω to ground.

- *GMSL2 User Guide*
- Device Errata

The Channel Specification contains physical layer requirements for the PCB traces, cables, and connectors that constitute the GMSL link. The Hardware Design Guide contains recommendations for PCB design, applications circuits, selection of external components, and guidelines for use of GMSL signal integrity tools. The User Guide contains detailed programming guidelines for GMSL device features. Errata sheets contain deviations from published device specifications, and are specific to part number and revision ID. Contact the factory for these documents.

Recommended Operating Conditions, External Component Requirements and ESD Protection

Table 2. Recommended Operating Conditions

PARAMETER	PIN	NOMINAL VOLTAGE	MIN	TYP	MAX	UNIT
Supply Voltage Range	V _{DD18}		1.7	1.8	1.9	V
	V _{DD}		0.95		1.26	
Maximum Supply Noise	V _{DD}	1.0V		25		mV _{P-P}
		1.1V		37.5		
		1.2V		50		
	V _{DD18}			25		
Operating Junction Temperature, T _J			-40		+125	°C

Note: Supply noise < 1MHz. Supply voltage ripple is assumed to be symmetric around the measured DC supply voltage. For example, 25mV_{P-P} means $\pm 12.5\text{mV}$ peak voltage.

[Table 3](#) details critical components that must be connected to the specified pins for correct operation.

Table 3. External Component Requirements

COMPONENT	SYMBOL	CONDITION	VALUE	UNIT
XRES	R _{RXRES}	Connect R _{RXRES} resistor between XRES pin and ground. Total variation not to exceed $\pm 3\%$ including tolerance, temperature, and lifetime drift (e.g., $\pm 100\text{ppm}/^\circ\text{C}$ temperature coefficient and $\pm 1\%$ lifetime drift).	$402 \pm 1\%$. Use a single resistor.	Ω
Link-Isolation Capacitors	C _{LINK}	Place in series and in close proximity to the SIO pins (pins 12 and 13).	0.1	μF
Termination Resistor for SIO_N pin	R _{TERM}	Connect in series with C _{LINK} capacitor between SION and ground. Place near associated SION pin.	$49.9 \pm 1\%$	Ω
Crystal		Place as close as possible to pins X1 (pin 8) and X2 (pin 9), and connect between these two pins.	$25\text{MHz} \pm 200\text{ppm}$	
Crystal Load Capacitors		Use crystal-loading capacitor guidance from the crystal manufacturer. Select values that compensate for the X1 and X2 input and PCB node capacitances. Place the capacitors as close as possible to pins X1 (pin 8) and X2 (pin 9).	Crystal dependent	pF

Table 3. External Component Requirements (continued)

V_{DD18} Decoupling Capacitors*		Place 0.01 μ F, 0.1 μ F capacitors as close as possible to each V_{DD18} pin (pins 11 and 16). Include a minimum of 10 μ F bulk decoupling on the PCB.	0.01 + 0.1 + 10	μ F
V_{DD} Decoupling Capacitors*		Place a 0.01 μ F, 0.1 μ F capacitors as close as possible to pin V_{DD} (pin 15). Include a minimum of 10 μ F bulk decoupling on the PCB. See configuration information in the Power Supplies section.	0.01 + 0.1 + 10	μ F
CAP_VDD Decoupling Capacitor		Place a 0.1 μ F capacitor as close as possible to pin 14. Include a minimum of 10 μ F bulk decoupling near the pin.	0.1 + 10	μ F
Open-Drain Pullup Resistors		Application-specific. Quantity and values depend on multifunction GPIO pin configurations.		
Resistors for Configuration Pin Resistor Divider	R1, R2	Place resistor-divider close to pin 3 (CFG0).	Use $\pm 1\%$ tolerance resistors. See Table 7 .	Ω
	R1, R2	Place resistor-divider close to pin 4 (CFG1).	Use $\pm 1\%$ tolerance resistors. See Table 8 .	Ω

*With exception of CAP_VDD, power supply decoupling capacitor values are recommendations only. It is the responsibility of the board designer to determine what decoupling is necessary for the specific application.

Introduction

Analog Devices' tunneling GMSL2 serializers and deserializers provide end-to-end data integrity of both sensor data and side-channel data, while also providing sophisticated link management for high-speed, low bit-error-rate, and serial data transport. They support a comprehensive suite of sensor and communication interfaces over a single wire. The serializer provides 3Gbps forward and 187.5Mbps reverse packetized data transmission over each fixed-speed link.

The following sections provide a brief overview of the device functions and features. Contact the factory for additional information, and details on configuration of each function and feature.

Product Overview

The MAX96717R serializer converts MIPI CSI-2 to single-link GMSL2. See [Figure 11](#). It also sends and receives side-channel data, enabling full-duplex transmission of forward-path sensor data and bidirectional data over low-cost 50Ω coax cables meeting the GMSL2 channel specification.

The MAX96717R has a four-lane D-PHY v1.2 that supports a data rate of 108Mbps to 600Mbps per lane. Four virtual channels are also supported.

The MAX96717R is intended for use with a GMSL2 deserializer such as the dual-port MAX96716A/B/F, a quad-port MAX96712 or MAX96722, or a GMSL3 deserializer operating in GMSL2 mode. For example, when used with the MAX96716F, several modes are supported. A single sensor can be connected to an SoC in GMSL2 modes at a data rate of 3Gbps, as shown in [Figure 11](#). Two MAX96717R serializers can be used with one MAX96716F deserializer to connect two sensors to two SoC devices (see [Figure 12](#)). The cable types, sensor timing, and data rates do not have to be the same. Data from link A and B are output on separate, dedicated CSI-2 ports for capture by the SoCs.

Figure 11. Single Link

Figure 12. Dual-Link, Separate Data Type

The deserializers support data aggregation, as detailed in [Figure 13](#). The sources can have different video timing and resolution. The SoC identifies the video source by reading the packet's virtual channel. If both sources use the same virtual channel, the MAX96717R can assign a different virtual channel in Pixel mode. Reassignment of up to 16 data types is also possible in Pixel mode. The aggregated data can be replicated to both MIPI ports, allowing multiple SoCs to process the same data, as shown in [Figure 14](#).

Figure 13. Dual-Link, Data Aggregation

Figure 14. Dual-Link, Data Aggregation and Replication

The MAX96717R is an ideal sensor serializer to use (it has a CSI-2 interface, and single or multiple data types) when various cameras and/or sensors need to be supported.

Tunneling and Pixel Modes

The MAX96717R is specifically designed for advanced driver assistance systems (ADAS), where data integrity is a key safety requirement. Prior GMSL2 solutions supported only Pixel mode for transporting received data from a MIPI CSI-2 interface over the GMSL link. In Pixel mode, the CSI-2 data is depacketized at the serializer's CSI-2 input interface. The received CSI-2 packet header includes an error correction code (ECC), which is checked and removed at the serializer input. The received CSI-2 packet footer contains the CSI-2 cyclic redundancy check (CRC), which is also checked and removed.

Video line pixel data and video routing information, such as data type and virtual channel, are received and extracted at the CSI-2 interface. Both video pixel data, control channel data, and routing information are input into a scheduler in the serializer. The scheduler packetizes and encapsulates the data using GMSL protocol and sequences data transmission across the GMSL link. Video data transport across the GMSL link is protected by line CRCs that are part of the GMSL protocol.

The deserializer receives the GMSL packets and verifies the GMSL2 line CRCs. A CSI-2 interface at the deserializer output encapsulates each video line using CSI-2 protocol and outputs it in CSI-2 format across a CSI-2 interface to the SoC (see [Figure 15](#)).

Figure 15. Pixel Mode

In Tunneling mode, the received CSI-2 ECC byte and CRC bytes are checked at the serializer input. These, as well as routing and pixel data, are received as a byte stream. The byte stream is split into smaller packets that are encapsulated using GMSL2 protocol.

The serializer adds a line CRC, protecting transmission across the GMSL channel. This CRC covers the entire GMSL2

packetized byte stream for a video line (see [Figure 16](#)). The deserializer receives the transmitted GMSL2 packets and control channel packets, checks and removes the GMSL CRC, separates the video data from control data, and reconstructs each received CSI-2 packet that is output to the SoC on a CSI-2 interface. A CRC is calculated on the video data output on the CSI-2 interface. This CRC is compared by the deserializer to the original CRC received from the video source. This comparison guarantees that the entire data packet output on the standard MIPI interface is identical to that received at the serializer input. Tunneling mode is more bandwidth-efficient if multiple data types are being sent. Because data received at the serializer input and data output from the deserializer are verified to be identical, Tunneling mode does not allow for the processing of video data, such as watermarking or lossy data compression. Different data rates and lane counts on the serializer and deserializer are still possible.

Figure 16. Tunneling Mode

Video Pipeline

The video channel is designed to transmit video data received from the CSI-2 interface to the deserializer side of the link. The following data types are supported: RGB888, RGB666, RGB565, YUV422-8, YUV422-10, RAW8, RAW10, RAW12, RAW14, RAW16, RAW20, User-Defined, Embedded, and Null. By default, the bits per pixel (bpp) of the video stream is automatically detected by inspecting the data type of the CSI-2 packets. If a video stream with a different bpp is sent through the same video pipe in Pixel mode, disable the auto-detect through a register write. Video input data consists of color, HS, and VS synchronous to the pixel clock (PCLK). Reception of video is detected using the PCLKDET function. Video flows through the design as described in the following sections.

Video Pipes in Pixel Mode

Video data transport in GMSL2 Pixel mode is based on the concept of video pipes. Carrying data in pipes allows GMSL2 to bridge different digital video interfaces and perform watermark generation and detection. (Note: Watermark generation is not supported by this device.) A pipe carries video stream(s) and video synchronization data and operates in one of the following modes:

- Mode 1: Streams with constant bits per pixel (bpp) of up to 24bpp. The bpp of the streams must be the same.
- Mode 2: Streams with 16, 14, 12, 10, or 8bpp. Streams less than 16bpp are padded with zeros.
- Mode 3: Streams with two different bpp rates. The bpp of one stream must be twice the bpp of the other stream. The higher bpp stream maximum is 24bpp.

In all modes, a pipe can carry multiple concurrent video streams, with each stream having different virtual channels and data types.

Modes 1 and 3 carry data at full bandwidth, but put more restrictions on bpp than Mode 2. Mode 2 allows streams with different bpp rates, but streams of less than 16bpp are carried using more bandwidth than necessary on the GMSL2 link because of zero-padding. Mode 1 or 3 are sufficient for most applications. Mode 2 requires less programming and is more convenient if the application does not require maximum link bandwidth.

The MAX96717R has a single input port and one video pipe. The pipe in the MAX96717R has a dedicated MIPI receiver buffer. The retiming buffer has the capacity to buffer 96 24-bit pixels. This allows sufficient memory for transmission of a line to start, and not overflow or underflow. The number of pipes used by a deserializer is equal to the number of pipes used by all connected serializers.

After data exits a retiming buffer, it goes through a crosspoint switch and a data type (DT) and virtual channel (VC) reassignment stage. If the video source has a CSI-2 output, packet DT and VC can each be left as-is or reassigned by register programming. Up to four DT/VC incoming pairs can be mapped to four DT/VC outgoing pairs.

RGB888 Video-Pattern Generator

The RGB888 video-pattern generator (VPG) is an auxiliary block that can be used for a variety of purposes, such as replacing video from the peripheral with the video pattern generated by the VPG. Various patterns can be generated when configured using the configuration registers. The VPG creates a checker board pattern and gradient using RGB888 data.

Note: The VPG is only for use in Pixel mode.

Tx Crossbar

Data from the video input is captured and optionally multiplexed with the generated patterns from the VPG. Final data goes into a crossbar multiplexer that allows any input bit to be mapped to any output bit using the configuration registers. The crossbar should only be used in Pixel mode.

GMSL2 Packet Protocol

Packet Protocol

GMSL2 is a fixed-rate, packet-base transmission protocol that is designed to efficiently and dynamically carry multiple types of communication channels concurrently. Link bandwidth is only used by a channel when data is being sent. The link bit rate is based on a constant-frequency link clock generated from the 25MHz crystal oscillator. The link clock does not have any relation to the video-pixel clock.

GMSL2 uses a packet-based protocol to seamlessly share the link bandwidth between communication channels in a flexible way. Bandwidth allocation is dynamic, so that if a certain channel is not active, it does not consume any link bandwidth, and all the remaining active channels can share the full link bandwidth. Maximum packet size is limited to prevent a single channel from utilizing the link bandwidth for an extended time. In most cases, available link bandwidth exceeds the bandwidth requirement. Idle packets are used to fill in the unused link bandwidth.

The same data protocol is used on forward and reverse channels, and for both video and control-channel data.

Tunneling Mode

Tunneling mode transmits all MIPI CSI-2 content, without modification, over the serial link. Unlike Pixel mode, the received CSI-2 payload is not decoded. Unchanged CSI-2 bytes are split into smaller GMSL packets that are encapsulated and protected with GMSL CRCs, and are transported across the link. This means the CSI-2 headers and footers generated by the video source, including ECC and CRC, are preserved through the GMSL link, and can be decoded by the host connected to the deserializer. This provides end-to-end data integrity critical for ADAS vehicles.

Pixel mode checks the ECC and CRC packets for errors at the serializer, and then removes them prior to converting the payload to pixels and transmitting over the GMSL2 link. In Pixel mode, the deserializer recalculates and inserts the CSI-2 ECC and CRC packets. Both Tunneling and Pixel modes have CRC protection of the serial-link payload so any GMSL link errors are detected. However, an error in recalculating the ECC/CRC packets in the deserializer is not detected by the SerDes, but is detected by the MIPI video sink device.

CRC Generation and Checking

Every packet (excluding Idle and Acknowledge packets) can be protected by a 16-bit packet CRC. Each packet type can be individually configured to enable or disable packet CRC. By default, all low-bandwidth channels have packet CRC. Note that since Acknowledge packets contain no data and the header is repeated, CRC is unnecessary. Although the video channel disables packet CRC in default settings in order to maximize usable bandwidth, video-line CRC (a 32-bit code at the end of each DE or HS pulse) is enabled by default to provide data protection.

The 16-bit packet CRC generator polynomial is: $x^{16} + x^{15} + x^2 + 1$.

Control-Channel Retransmission on Error

Automatic Repeat Request/Automatic Retransmission (ARQ)

Communications channels with control data (e.g., I²C, GPIO) are relatively low bandwidth, but require the highest data integrity protection. An optional automatic packet retransmission method, automatic repeat request (ARQ), is employed here. ARQ works in conjunction with 16-bit packet CRC to detect whether packets are received with or without error.

Packets are appended with a 2-bit sequence number at the transmit side, and an acknowledge is sent from the receiver side upon successful receipt of each data packet. These packets are stored on the transmit side until acknowledged. If the acknowledge does not arrive in a predetermined interval or the sequence number of the acknowledge does not match the expected value, the packet waiting at the top of the queue is automatically retransmitted.

The Acknowledge packet uses the same header field as low-bandwidth packets, but begins with a different special symbol to distinguish it from regular data packets. This simplified format keeps retransmission exchanges independent from the communication channel. Note that this smaller packet format contains no data, obviating the need for full 16-bit CRC. Instead, the header symbol is sent twice in the packet and checked against each other to ensure a match. The Acknowledge packets also include a 2-bit sequence number that is the same sequence number of the correctly received data packet. The data packet transmitter keeps track of which packets are acknowledged.

Scheduler/Arbiter

A scheduler transmits packets with high-priority values before lower priority values. Each communication transmit adapter sets a priority for the packet request before transmitting data to the remote side. The priority value is 2 bits, allowing for four different settings: 0 = Low, 1 = Normal, 2 = High, and 3 = Urgent. The scheduler, provided there is sufficient link bandwidth, chooses to transmit the packet with the highest priority among the pending active requests. Priority levels become more important as link bandwidth becomes scarce. Prioritization should be assigned accordingly.

In most cases, each transmitter adapter should use the normal priority setting (priority = 1) to allow the scheduler to choose the transmission schedule based on recent bandwidth usage. Packet priority can be increased if packets require low latency or have waited for a length of time. For example, packets with maximum latency requirements can have increased priority if the packet request has not been serviced until half of the maximum latency requirement has elapsed. This can also be used for communications channels with continuous data flow (e.g., video). Priority is increased when the transmit adapter data buffer approaches overflow. Conversely, register configuration allows overriding the priority settings of each channel. This option is useful if the host µC wants to prioritize one channel over the others.

Note: Communications channels with very relaxed latency requirements can use the low-priority setting (priority = 0). These low-priority packets are not serviced by the scheduler if there are any pending requests of a higher priority setting. In this arrangement, link bandwidth assignment can reach the theoretical maximum for video. Low-priority packets can then be transmitted during video horizontal blanking time, during which the video channel bandwidth usage drops considerably.

Bandwidth Sharing

The GMSL2 link bandwidth is shared flexibly between different communication channels including video/data, I²C control channel, and GPIOs, as well as various protocol-specific data exchanges including information frames, sync, and acknowledgments. Each channel must request the link for packet transmissions. This flexibility comes from packet-based transmission format and dynamic bandwidth allocation. If a certain channel is not active, it does not consume any link bandwidth, leaving the full link bandwidth available for all active communication channels to share. The packet-based protocol allows fulfilling this sharing requirement. The maximum packet size is limited to 64 20-bit words to prevent one single channel from monopolizing the link bandwidth and to ensure other channels are served. The total-link bandwidth used by all communication channels cannot exceed the fixed available link bandwidth or errors occur.

The data and control-channel packets can be assigned a priority level. There are four priority levels: low, normal, high, and urgent. The scheduler transmits the packet with the highest priority among the pending requests. Packets with maximum latency requirements can be assigned an increased priority.

A bandwidth sharing scheme is employed in cases of multiple pending requests of the same priority setting to avoid creating buffer overflows. Without bandwidth sharing, a burst data request from a channel can cause buffer overflow in other communications channels on the link. Bandwidth sharing, however, considers predefined bandwidth share ratios and recent bandwidth usage averages of each type of communication channel to avoid buffer overflows and ensure all channels are served.

An arbiter continuously measures the bandwidth usage of each channel and filters the data according to the analysis of the moving averages. This data is then compared to assigned bandwidth share ratios. In order to ensure link bandwidth parity, the arbiter takes this recent bandwidth usage information in order to decide which channel is allocated to use the link for each new packet transmission request.

GMSL2 Physical Interface

Adaptive Equalization (AEQ)

The GMSL2 devices automatically adapt the receiver's characteristics to compensate for the insertion and return loss characteristics of the channel that consist of the cables, connectors, and PCBs. This approach optimizes performance on any channel that meets the GMSL2 channel specification. The equalizer architecture makes GMSL2 links robust against noise, crosstalk, and reflections. Initial adaptation is performed during link lock and is then invoked at a rate of approximately 1Hz to track temperature and voltage variations. The adaptation process optimizes the equalizer coefficients to minimize the intersymbol interference observed at the output of the equalizer.

Echo Cancellation

The GMSL2 link includes an echo cancellation circuit in both the serializer and deserializer to enable simultaneous transmission of high-speed video data and bidirectional control data.

Spread Spectrum

Spread spectrum is used to reduce electromagnetic interference (EMI). Optional spread-spectrum clocking (SSC) is available to mitigate electromagnetic interference emitted from the device and interconnections and provides additional margin. SSC reduces peaks in the frequency spectrum by spreading the energy over a wider bandwidth. The forward-channel, spread-spectrum frequency is programmable in the range of 10kHz to 40kHz, and the frequency deviation is programmable in the range of 0% to $\pm 0.125\%$. If no forward-channel, spread spectrum is programmed, up to 0.5% frequency deviation can be tolerated.

Link Lock

Figure 17. GMSL2 Lock Time

Figure 17 illustrates the sequence that is used to characterize GMSL2 link lock time. Device A is the first device (serializer or deserializer) to power up or resume operation from a RESET_LINK state. Device B is the device (deserializer or serializer) at the other end of the GMSL link.

Link lock indicates that the data receive paths are locked (forward channel in the deserializer, reverse channel in the

serializer). Video and control channel functions (I²C, GPIO) can be used immediately after link lock is asserted.

The device establishes single-link GMSL2 connectivity and link lock automatically following power-up. This is an indication that the cable is plugged in, and the system is up and running. Lock is obtained with no interaction between the µC and GMSL devices. Both serializers and deserializers have an open-drain LOCK output pin and a related status register.

The MAX96717R has only one link; therefore, it does not support dual-link and splitter configurations.

The GMSL2 link uses the crystal as the reference clock for GMSL2 links, so a valid video input (PCLK) is not needed for the GMSL2 link to lock.

Notes:

1. The lock sequence is initiated by the release of the PWDNB pin or the RESET_LINK bit in either the serializer or the deserializer.
2. The lock time is measured from the PWDNB or the RESET_LINK release, whichever is later, on either the serializer or the deserializer to the lock being asserted.
3. The PWDNB/RESET_LINK states on the two sides of the link must have overlap when both the devices are in PWDNB/RESET_LINK mode prior to the lock process starting.
4. If RESET_LINK is used to initiate the lock, PWDNB is assumed to be high after power-up (normal operation).
5. If PWDNB is used to initiate the lock, RESET_LINK is assumed to be low after power-up (normal operation).
6. Device A is the first device (serializer or deserializer) to be powered up. Device B is the device (deserializer or serializer) at the other end of the GMSL link.
7. To achieve the specified lock time, time delay t_{RD} (delay between the release of the PWDNB/RESET_LINK on the two devices) must be less than 90ms. If this timing cannot be guaranteed, contact the factory for guidance.
8. Lock time and maximum allowed t_{RD} vary between different families of GMSL devices. They depend on the characteristics of both the serializer and deserializer. The typical lock time of a specific link can be best estimated as the longer of the lock times specified in each device data sheet. Similarly, the maximum permitted t_{RD} for a specific link can be estimated as the smaller of the values specified in each device data sheet. For further guidance, contact the factory.
9. If there is an instantaneous interruption to link lock, a period of 100ms following loss of lock should be provided to enable the link to automatically recover prior to any ECU initiated resets being issued. This will minimize any disruptions caused by a transient loss in connectivity.

GMSL2 Bandwidth Calculations

The GMSL2 forward link has a fixed link rate of 3Gbps for the MAX96717R. The reverse-link rate is also fixed at 187.5Mbps. The GMSL2 protocol and channel coding overhead is roughly 16%. This leaves approximately 2.6Gbps of video payload data throughput in the forward direction and 162Mbps in the reverse direction.

Users must ensure that worst-case use cases do not exceed the available throughput of the forward and reverse links. Analog Devices' evaluation kit (EV kit) GUI includes a bandwidth (BW) calculator that can be used for initial bandwidth requirement estimates. Analog Devices also has other tools to calculate link-bandwidth utilization. Consult the factory for high-bandwidth use cases to ensure error-free performance.

[Table 5](#) provides rough estimates of the bandwidth utilization for each communication channel.

Table 5. Forward- and Reverse-Link Bandwidth Utilization

DATA	APPROXIMATE BANDWIDTH UTILIZATION

Definitions:

H = Horizontal resolution (active pixels)

V = Vertical resolution (active video lines)

fps = frames per second

bpp = bits per pixel

MIPI data rate = Aggregate data rate of all lanes in the Mobile Industry Processor Interface (MIPI).

Figure 18. Video Frame Format for Bandwidth Calculation

Control Channel and Side Channels

A μ C or other controller can send and receive control and side-channel data over the GMSL2 serial link simultaneously with high-speed video data. The MAX96717R supports I²C (register access) and GPIO. Both can pass data through the GMSL2 link. The GMSL2 device registers can be accessed and configured only through the I²C interface or remotely through the GMSL link.

The side channel, with its various interfaces, is accessed using multifunction pins. Multifunction pins have a default function and can be programmed to an alternate function after power-up. Due to a practical limit in the number of pins available on a given device, not all interfaces can be simultaneously supported. See [Pin Descriptions](#) and [Table 9](#) for default and alternate multifunction pin functions, as well as available combinations of interfaces.

I²C

The main I²C is located on the SDA and SCL pins of each GMSL2 device. The I²C (SDA, SCL) interface is selected by the CFG0 pin voltage at power-up (see [Table 7](#)). The selected interface provides main access to both GMSL2 registers and device registers from either end of the link.

The main microcontroller (μ C) can reside on either end of the link (usually the serializer side for display applications and the deserializer side for camera applications). The MAX96717R supports dual main microcontrollers, provided that software arbitration, such as token passing, is used to prevent packet collisions. The control channel allows only one main μ C to communicate at a time. I²C outputs are open-drain and require appropriately sized external pullup resistors for proper operation.

For detailed main channel programming information, see the [Control-Channel Programming](#) section under Applications Information.

General Purpose Input and Output (GPIO)

The MAX96717R provides up to 7 GPIO/GPO/GPI, dependent on device feature utilization. GPIOs are typically used to tunnel low-speed (< 100Kbps) signals over the GMSL2 link. A GPIO tunnel can be set up in the forward or reverse direction. MFP pins can be programmed as GPI, GPO (push-pull output), or ODO (open-drain output).

Each GPIO pin can be configured as an input, output, or input/output by programming the GPIO_TX_EN and GPIO_RX_EN register bits of each GPIO pin. Unwanted loop behavior is avoided for pins configured as input/output (e.g., when the pin is driven by a transition received from the remote side, the driven GPIO transition is not transmitted back). GPIO pins may alternately be controlled and read solely from registers.

Most GPIO pins can be programmed for 1M Ω or 40k Ω pullup or pulldown (or none).

When a GPIO is programmed as GPO, the GPO can generally be programmed for open-drain or push-pull output.

A GPIO packet has 32 possible GPIO channel IDs. Each GPI is mapped to a channel ID according to the GPIO_TX_ID register. On the receiving end, each GPO outputs the received data with a programmed GPIO channel ID corresponding to the GPIO_RX_ID register for that pin. This provides flexibility in determining which GPIO input drives which GPIO output.

GPIO transmissions are transition based; a GPIO packet is created and transmitted on the GMSL2 link when a rising- or falling-edge transition is detected at a GPIO pin. Several GPIO transitions at different GPIO pins can be grouped into a single packet. These pin transitions can be transmitted in two different modes: regular and delay-compensated.

The GPIO channel is not bandwidth efficient and should be used for low-speed signals only. Each GPIO transition uses 40 to 80 bits on the GMSL2 link for transmit and 40 to 60 bits on the reverse (due to received ACK packets). Bandwidth usage values vary based on channel configuration: ARQ enable, CRC enable, and double-header enable all impact channel bandwidth usage.

The state of each GPIO can be read or written by register, either locally or remotely, over the GMSL2 link by a μ C using the control-channel I²C interface. In non-delay-compensated mode, channel latency is not fixed. The GPI transition is sent as soon as possible, based on priority and available link bandwidth. This variable delay is a result of multiple communication channels sharing the link. Non-compensated mode should be used with signals tolerant to delay variation (i.e. μ C interrupts). Priority can be set for GPI pins using registers. If no priority is set, GPI transitions are transmitted in the order they occur. However, when priority is set, transitions on GPI with higher priority are transmitted sooner.

Typical GMSL2 device delays for forward-link and reverse-link rates are shown in [Table 6](#).

Table 6. Typical GPIO Delays for Forward-Link and Reverse-Link Transmission

DIRECTION	DELAY COMPENSATION	DELAY (μs)
GPIO forwarding from serializer to deserializer	0	1
	1	3.5
GPIO forwarding from deserializer to serializer	0	6
	1	15

Delay in Non-Compensated Mode

In non-compensated mode, the value of the transition is transmitted along with the GPIO channel ID. Note that GPIO channel latency is not fixed; the GMSL2 link has variable delay as a result of multiple communication channels sharing the link. A maximum latency limit is established by the GMSL2 bandwidth-sharing scheme, but significant fluctuation remains. Non-compensated GPIO mode should be used with signals invariant to the delay variations (e.g., μC interrupts).

Delay-Compensated Mode

In delay-compensated mode, a timestamp value is transmitted in addition to the value of the transition and the GPIO channel ID. This timestamp is a high-resolution value sampled by an internal 600MHz clock that records when the GPIO transition is detected at the input. The remote-side chip uses the timestamp value to wait and output the GPIO transition after a total fixed delay from the GPIO input transition. This method mitigates possible variable latency issues by making the total GPIO input-to-output delay a precise, fixed value. Delay-compensated GPIO mode should be used for signals for which the relative timing of rising and falling edges are important (e.g., PWM, camera frame sync, radar ramp trigger).

Frame Sync

In surround-view camera applications a frame-sync signal is usually required by the sensors to synchronize the output of a frame with the other cameras in the system. Most GPIOs can be configured as GPI and linked to a frame-sync signal generated by a surround-view camera electronic control unit (ECU).

Eye-Opening Monitor

The eye-opening monitor (EOM) enables GMSL2 parts to monitor the link margin on an active link and generate an interrupt if it falls below an acceptable level. For example, if a cable is damaged, the link can run error-free, but have less link margin than desired. This allows the customer to react proactively to deteriorating cable performance before any link errors occur. GMSL2 parts can measure the horizontal or vertical eye-opening of the equalizer's output. The measurement is activated automatically at a rate of approximately 1Hz once a link is active. The EOM block compares the data sampled at the center of the eye with a sample offset in phase (for the horizontal EOM) or offset in voltage (for the vertical EOM). An eye-opening figure of merit is then reported. The EOM can trigger an interrupt or a reset if the opening falls below user-defined thresholds.

Other Functions

The MAX96717R serializer has a main I²C control-channel interface that a μC uses to access serializer and deserializer registers, as well as peripheral devices from either end of the link.

The MAX96717R provides up to 7 GPIOs, dependent on device feature utilization. GPIOs are typically used to tunnel low-speed (< 100Kbps) signals over the GMSL2 link. A GPIO tunnel can be set up in the forward or reverse direction.

The devices include a video crossbar, which can be used to reorder the color and sync signals. It can also be used for D-PHY lane remapping and phase inversion, if desired.

GMSL2 devices incorporate numerous link margin optimization and monitoring functions to ensure a high link margin. Adaptive equalization periodically (~1Hz) optimizes the link margin to adapt to environmental changes and cable aging. An eye-opening monitor function for continuous link margin diagnosis with various threshold alarm levels is available for run-time alerts of link degradation. A PRBS checking function is available to verify the correct link and video-channel operation.

Video PRBS

The video channel of the serializer includes a PRBS pattern generator that operates with bit error verification in the

deserializer to test channel operation. The PRBS generator works with the clock received from the source.

To run the video PRBS test, first enable the PRBS generator on the transmitter side, then enable the checker on the receiver side. The PRBS checker automatically syncs itself to the incoming PRBS pattern. If it is unable to sync within a few cycles, it asserts the PRBS_FAIL register. To stop the PRBS test, first, turn the checker off on the receiver side, then turn the generator off on the transmitter side.

PRBS errors can be read from the VPRBS_ERR register on the deserializer side. Any PRBS error causes the ERRB pin to go low in the deserializer by default (see VPRBS_ERR_OEN and VPRBS_ERR_FLAG register bits).

Note: The video channel shares link bandwidth; it is possible to have a bit error on the link which does not cause a video PRBS error.

MIPI CSI-2 Input Interface

Lane Configurations and Data Rates

Image data is received on a unidirectional MIPI CSI-2 v1.3 input port. The port should be configured to use D-PHY v1.2. The interface offers a high degree of flexibility. When configured as D-PHY, the interface supports four differential lanes. To ease the PCB layout, lane swapping is supported independently of how many lanes are used and can only be swapped within that port. Lane polarity swapping within a lane is also supported. [Figure 19](#) shows the options and default mapping. D-PHY mode supports data rates up to 600Mbps per lane.

Figure 19. MIPI CSI-2 Lane Mapping Options and Default Settings

Clocking

The device CSI-2 interface supports both continuous and burst-mode clocking in D-PHY mode.

CSI-2 Virtual Channel and Data Type Interleaving

The device supports virtual channels, including virtual channel extension (VCX), introduced in CSI-2 v2.0, enabling up to 4 virtual channels.

If operating in the Pixel mode, the virtual channel and/or data type received from the CSI-2 source can be reassigned

(Pixel mode only) or passed through (Pixel and Tunneling modes).

Minimum Blanking

The minimum horizontal blanking period needed by the CSI-2 serializers and deserializers is the maximum of either 40 pixels or $300\text{ns} + 370\text{UI}$ (where UI is defined as the period of the CSI-2 lane rate). For most cases, 40 pixels is the larger number. Minimum vertical sync width is one video line. Minimum vertical front porch is one video line. Recommended vertical back porch is one video line.

The minimum vertical back porch in Pixel mode is the maximum of:

- 40 pixels
- $300\text{ns} + 370\text{UI}$

The minimum vertical back porch in Tunneling mode is the maximum of:

- 40 pixels
- $200 \times \text{PCLK}$ periods + 233ns, where $\text{PCLK} = \text{total MIPI data rate}/24$
- $300\text{ns} + 370\text{U}$

These calculations provide rough estimates. Use the GMSL GUI bandwidth calculator for more precise values.

Figure 20. Video Timing

MIPI End-to-End Packet Spacing

When in Tunneling mode, timing requirements must be met to avoid a false line-CRC error flag. As shown in [Figure 21](#), the end-to-end packet spacing (L1, L2, ... LN, LE, LS) must be a minimum of $200 \times \text{PCLK}$ cycles + 233ns, where PCLK is the total MIPI data rate/24. This limit is typically a concern for the line-end short packets that follow the last-long data packet of a frame. An alternate solution is to disable the line-CRC check and rely on the MIPI CSI-2 packet CRC, which is a valid verification of error-free data reception.

Figure 21. End-to-End Packet Spacing

CFG Latch at Power-up Pins

Voltage levels at the CFG0 and CFG1 pins are latched at power-up or upon a low-to-high transition of PWDNB. These levels set initial register values and functional modes that may not be easily programmed through I²C after the IC powers

up. The CFG pins select I²C address and Tunneling or Pixel mode (see [Table 7](#) and [Table 8](#)).

The voltage level for each pin is set by an external precision resistor-divider connected between V_{DD18} and ground or, for some configurations, by a single resistor connected to V_{DD18} or ground. [Table 7](#) and [Table 8](#) show the recommended resistor values to select each configuration. The voltage level at the CFG pins is latched approximately 1ms after all MAX96717R supplies reach the minimum levels required by the POR (power-on-reset) circuit.

If the requirements described in [Table 7](#) and [Table 8](#) are met, the CFG pins can be used as general-purpose outputs or MFP function outputs after the input voltage levels are latched. CFG pins cannot be used as general-purpose inputs.

Table 7. CFG0 Input Map

CFG0 INPUT VOLTAGE SPECIFICATION (% OF V _{DD18}) (NOTES a, b)			SUGGESTED RESISTOR VALUES (1% TOLERANCE) (NOTE c)		MAPPED CONFIGURATION
MIN (%)	TYP (%)	MAX (%)	R1 (kΩ)	R2 (kΩ)	DEVICE ADDRESS
28.8	32.1	35.5	68.1	32.4	0x80
40.7	44.0	47.4	56.2	44.2	0x84

Notes

- Resistor divider tolerance, V_{DD18} supply ripple, and external loading must not cause the CFG0 input voltage to exceed the maximum or minimum limits.
- Other than the CFG0 input resistor divider, any load on CFG0 must be $\geq 25 \times (R1 + R2)$.
- Each resistor in the voltage divider must be $\leq 100\text{k}\Omega$.

Table 8. CFG1 Input Map

SPECIFICATION (% OF V _{DD18}) (NOTES a, b)			SUGGESTED RESISTOR VALUES (1% TOLERANCE)		MAPPED CONFIGURATION (NOTE c)
MIN (%)	TYP (%)	MAX (%)	R1 (kΩ)	R2 (kΩ)	TUNNEL/PIXEL MODE
52.6	56.0	59.3	44.2	56.2	Tunnel
88.3	100	100	10	OPEN	Pixel

Notes

- Resistor divider tolerance, V_{DD18} supply ripple, and external loading must not cause the CFG1 input voltage to exceed the maximum or minimum limit.
- Other than the CFG1 input resistor divider, any load on CFG1 must be $\geq 25 \times (R1 + R2)$. Each resistor in the voltage-divider must be $\leq 100\text{k}\Omega$.

Multifunction Pin Assignments

Side-channel functions are enabled by programming multifunction pins. Each MFP has several possible functions, but only one can be used at a time.

Some functions require only a single MFP, but most are implemented across a group of MFPs. For example, LOCK is a single MFP, but I²C takes several MFPs. A user selects MFP functions to suit each use case by programming the appropriate registers.

The [Pin Description](#) table shows default and alternate functions for each MFP, listed in order of priority (highest first). [Table 9](#) also shows priority, left to right, with highest priority on the left. A higher priority function must be disabled before a lower priority function is enabled, both by register writes.

Each MFP defaults to one of four slew rates, with each setting having a default output transition time setting. The transition time default suits the MFP's normal application requirements. Except for ODO_GPI_ functions, whose slew rates are fixed, the transition time of each setting can be changed from the default value through register programming. When the slew rate is changed, the transition time of the MFP is changed.

Transition times depend on the transition time setting. See [Table 10](#) for typical transition times.

Table 9. MFP Pin Function Map

PIN	FUNCTIONS	GPIO	POWER-UP DEFAULT	PIN SLEW DEFAULT (BINARY)
MFP0		GPIO0	DISABLED (1MΩ to GND)	10
MFP3	ERRB, LOCK	GPIO3	DISABLED (1MΩ to GND)	11
MFP4	RCLKOUT	GPIO4	DISABLED (1MΩ to GND)	11
MFP5		ODO5_GPI5	DISABLED (1MΩ to GND)	NA
MFP6		ODO6_GPI6	DISABLED (1MΩ to GND)	NA
MFP7		GPIO07	GPI7 (1MΩ to GND, Transmit the GPIO value across the GMSL Link)	11
MFP8	ERRB(Alt)	GPIO08	(Pulled High, Output Driver Enabled, and Ready to Receive and Output the GPIO Value from the GMSL Link)	11

Table 10. Control- and Side-Channel Typical Rise and Fall Times

PIN SLEW	RISE TIME (ns) (20% to 80%), $C_L = 10\text{pF}$	FALL TIME (ns) (80% to 20%), $C_L = 10\text{pF}$
00	1.0	0.8
01	2.1	2.0
10	4.0	4.3
11	9.0	10.0

Control-Channel Link and Power-Up

GMSL2 ICs are in power-down mode when PWDNB pin is low or when any of the power supplies are down. Register and configurations are set to default reset conditions.

The serializer and deserializer may power up in any order. After all power supplies are up and PWDNB is released, each device starts its power-up sequence and performs the following actions in sequence:

1. Latch at power-up pins register set. Set internal registers according to the selected configuration on CFG0 and CFG1 pins. See [Table 7](#) and [Table 8](#).
2. Control channel (I²C) is functional on the local side. Device registers are writable and readable.
3. The enabled PHY performs link calibration, equalizer adaptation, and data-channel locking. Once the link is locked, the device sets the LOCK pin high.
4. Control channel is available from remote side.

This entire link up process, from the time the last part's PWDNB input is brought high, takes approximately 35ms for any channels that meet the GMSL2 channel specification.

After the device is linked, it can be configured. This can be done either locally or over the control channel by a μC on either the serializer or deserializer side.

Device Reset

There are three general reset options available through register writes:

- RESET_ALL resets all blocks, including all registers, digital and analog blocks. This is similar to driving the PWDNB pin low and then high.
- Setting RESET_LINK resets all GMSL2 PHY-related digital logic and all data pipelines. After this bit is set, all control registers are still accessible through the local control channel. The link remains in RESET until RESET_LINK is

cleared.

- RESET_ONESHOT resets all GMSL2 PHY-related digital logic and data pipelines, and then automatically clears itself. This is similar to setting and clearing RESET_LINK. (**Note:** For the purposes of achieving predictable and expected link lock time, it is recommended that RESET_ONESHOT is not used while link lock operation is in progress. This includes the initial link lock attempt immediately following power-up. If link lock operation must be interrupted, RESET_LINK should be used instead to hold the link in reset until both SER and DES are ready to establish link lock. RESET_ONESHOT can be used any time after the link has been locked to reset and predictably relock the link.)

Registers that affect GMSL2 link operation (i.e., TX_RATE, RX_RATE, CXTP_A) should be programmed first, followed by RESET_ONESHOT. Alternatively, set these registers when RESET_LINK = 1, and then set RESET_LINK = 0.

Clocking

GMSL Reference Clock

The MAX96717R requires a 25MHz reference clock to generate the 3GHz line-rate clock and associated internal clocks. The MAX96717R can be clocked with an external 25MHz crystal with a frequency accuracy better than $\pm 200\text{ppm}$.

Reference Clock Generation

The MAX96717R can share a 25MHz crystal by providing a reference clock output. RCLKOUT can be used as a reference clock by another serializer or sensor in close proximity, eliminating the need for an additional external crystal or oscillator in a camera module. A programmable divider divides the reference clock RCLKOUT to be output at 25MHz, 12.5MHz or 6.25MHz. The reference clock is output on the MFP4 pin.

Spread-Spectrum Clocking

Analog Devices' GMSL2 links provide exceptional EMI performance. Optional spread-spectrum clocking (SSC) is available to further mitigate EMI caused by the emissions. SSC reduces peaks in the frequency spectrum by spreading the signal over a wider bandwidth. The spread has a 25kHz sawtooth modulation profile, programmable to deviate up to $\pm 1265\text{ppm}$ from the center frequency.

Error and Fault-Condition Monitoring

Both the serializer and deserializer have an open-drain, multipurpose error reporting and interrupt status output. The active-low ERRB pin is driven by the logical OR of a wide variety of error and event status indicators. The ability of each error condition to drive ERRB is maskable by register settings. Each error and event that can drive ERRB has a status flag within a sub-block of registers. So, the reason for assertion of ERRB can be determined by reading the register status.

When relying on the ERRB pin to convey the occurrence of an undervoltage event, connect an external $1\text{M}\Omega$ resistor between the ERRB pin and the ground, because ERRB is not a power-up default MFP function. As a result, following a reset that is triggered by an undervoltage event, the ERRB MFP pin transitions through high-impedance states. During an error state, the host device expects ERRB to drive logic-low, and the presence of the external $1\text{M}\Omega$ resistor enables the appropriate logic level to be maintained following the reset, alerting the host device that attention is required.

Power Supplies

The supply voltages for the MAX96717R can be brought up in any order. An on-chip power manager ensures that all supply rails are within limits before enabling device startup.

The serializer core runs on a regulated 1.0V supply (CAP_VDD) that is supplied from a built-in LDO that regulates the voltage received on the V_{DD} pin down to 1.0V. CAP_VDD also powers the output driver for the GMSL forward channel.

V_{DD18} is the analog and I/O supply. Connect to 1.8V. Power supply ramp time recommendation is $20\mu\text{s} < \text{ramp time} < 2\text{ms}$. The power supply ramp should be monotonic. Once the supply has reached the minimum supply voltage limit, it should not be allowed to drop below the specification.

Proper bypassing of power supplies is essential for high-frequency circuit performance. See [Table 3](#) and [Table 2](#) for power supply tolerances and noise requirements. Contact the factory for guidance on sharing supplies and optimizing supply decoupling.

Analog Devices provides power management ICs (PMICs) optimized for supporting serial link devices. Contact the factory for information.

PCB Layout Guidelines for GMSL

Proper circuit board design techniques are required for optimal GMSL link performance. This includes having at least a four-layer board to provide a proper ground plane reference, low thermal impedance, DC supply pin bypassing, PoC design, and high-speed GMSL trace impedance matching.

Ground Plane

A consistent ground plane, generally the second layer, is recommended to provide isolation from the high-speed GMSL traces and other traces and components that can couple noise onto the GMSL signals. This also simplifies the design of impedance-matched transmission lines. The ground plane is also key to provide a low thermal impedance to the device's exposed paddle.

High-Speed GMSL Traces

Proper transmission line design techniques are needed to achieve optimal GMSL link performance. The characteristic impedance must be closely matched to the desired impedance (50Ω single-ended). Any mismatch increases insertion loss and causes reflections (degrade return-loss). Use the following suggested layout practices:

- Use only 50Ω single-ended traces.
- Minimize length of high-speed traces.
- Minimize pad stubs by placing component pads directly on the signal trace.
- Use ground cutouts under pads as required (1.3x area of pad).
- Follow vendor layout recommendations for components, including connectors.
- Avoid sharp bends on high-speed traces.
- Place AC coupling capacitors within 500 mils (12mm) of the SIOx pins.
- Place the GMSL device as close to the serial-link connector as possible to minimize insertion loss.
- Stitch ground layers together with vias near high-speed traces.

Power-over-Coax Layout

When used, the PoC circuit needs to provide a low DC series resistance to the power supply while minimizing the loading of the GMSL forward and reverse signals. The PoC circuit behaves as a bias-tee and requires proper layout techniques for optimal GMSL link performance, including:

- Placing the smallest valued inductor (highest self resonant frequency) on the GMSL signal trace.
- Placing the next smallest valued inductor after the smallest.
- Using ground cutouts as needed under the first two inductors and resistors. See [Figure 22](#).
- Placing the PoC within 1/2 UI of the device, particularly for the deserializer.

Figure 22. Coax PoC Layout Example

Thermal Management

Power consumption of GMSL2 devices varies based on use case. The user must take care to provide sufficient heat dissipation with proper board and cooling design techniques. The exposed pad of the package must be connected to the PCB ground plane by an array of vias. This approach simultaneously provides the lowest electrical and thermal impedances.

System thermal management must keep the operating junction temperature below +125°C to avoid impacting device reliability.

Refer to [Thermal Characterization of IC Packages](#) for further guidance.

Unique Serial Number

The device has a set of registers that are programmed at the factory with a device level unique serial number (USN).

The USN can be read to identify and validate camera modules. In addition, the USN can be used as part of an authentication scheme to prevent counterfeit/malicious devices. The numbers are not sequential but are guaranteed to be unique.

Registers 0x1C50-0x1C5E contain the serial number.

Registers 0x1C5F and 0x1C60 contain a 16-bit CRC of the serial number.

These registers can only be read from the deserializer side and are not available through local serializer I²C pins.

Applications Information

Software Programming Model

Analog Devices' automotive serializers and deserializers are designed to follow a general software programming model. Except for features that require in-operation control channel accesses, such as the ASIL safety measures and interrupt handling, use the following programming model:

1. Set the impacted functional blocks to disabled or reset mode. A general method used to place the part in IDLE state is to stop all side-channel and video traffic, followed by a register write (RESET_LINK = 1) to stop the GMSL link.
2. The settings for each feature must be fully configured before it is enabled.
3. Establish the link by setting RESET_LINK = 0. Wait for the link to lock.
4. Start video and side-channel traffic.

If changing the configuration of a feature is required during the operation of other features, disable the feature that will be reconfigured, change its settings, and reenable it.

Programming Notes

This device does not require setting bits [6:4] in register 0x302. Legacy systems that are writing [6:4] = 3'b001 in register 0x302 are still valid and operation is guaranteed.

Control Channel Programming

GMSL device registers can only be accessed and configured through the I²C interface. By default, the I²C control channel is also sent to the remote side device and any peripheral connections. This allows control of the GMSL devices from either end of the link. For multimain configurations, with microcontrollers connected to both the serializer and deserializer, disabling the remote control channel through register settings is recommended to prevent bus contention.

The I²C interface uses clock stretching (holding SCL low) to account for timing differences between main and subordinate. It also allows time for data to be forwarded and received across the serial link. All local side I²C devices must support clock stretching by the GMSL2 device. Remote side I²C devices are not required to support clock stretching.

SDA and SCL lines operate as both an input and an open-drain output. Pullup resistors are required on SDA and SCL.

Each transmission consists of a START condition sent by a main, followed by the device's 7-bit subordinate address, plus a R/W bit, register address bytes, 1 or more data bytes, and a STOP condition.

Register addresses are 16-bits wide. Single or multiple data bytes can be written or read (by address autoincrements).

Device Address

Each device on the I²C control channel must have a unique address. The GMSL2 device address is set to one of several 7-bit addresses according to the voltage level of the CFG pins at power-up (see [Table 7](#) and [Table 8](#)). Note that a device address can be changed after power-up by writing to the DEV_ADDR register.

I²C Programming

Each device has an internal I²C subordinate for register access. The internal registers can be written and read according to the I²C protocol using the packet formats below.

I²C Write Packet Format

Figure 23. I²C Write Packet Format

Ordering Information

PART NUMBER	TEMP RANGE	PIN-PACKAGE
MAX96717RGTJ/V+	-40°C to +105°C	32 TQFN-EP
MAX96717RGTJ/VY+T	-40°C to +105°C	32 TQFN-EP

+ Denotes a lead(Pb)-free/RoHS-compliant package.

T Denotes tape-and-reel.

/V Denotes automotive qualified.

EP = Exposed pad.

Register Map

MAX96717R

Not all register bits in the register space are shown in the register table. Any bit not explicitly defined in the register table should be treated as reserved and not modified. When a write is required to a register with both defined and undefined register bits, first read the register's contents, then create a new register value by only changing the defined bits. Finally, write the new byte to the register (Read/Replace/Write).

Default values are provided for read-only register bits. Read-only bit states are changed at power-up according to the actual state of the device. To avoid overwriting these bits, treat read-only bits as undefined.

Note: See the Programming Notes section for mandatory register writes on startup.

ADDRESS	RESET	NAME	MSB							LSB

Register Details[REG0 \(0x0\)](#)

BIT	7	6	5	4	3	2	1	0		
Field	DEV_ADDR[6:0]						CFG_BLOCK			
Reset	0b1000000						0b0			
Access Type	Write, Read						Write, Read			
BITFIELD	BITS	DESCRIPTION			DECODE					
DEV_ADDR	7:1	Device Address Default value is set by the CFG0 pin as follows: CFG0 Device Address 000 0b1000000 001 0b1000010 010 0b1000000 011 0b1000010 100 0b1000010 101 0b1000000 110 0b1000010 111 0b1000000			0b0000000: I ² C write/read address is 0x00/0x01 0b0000001: I ² C write/read address is 0x02/0x03 ... 0b1000000: I ² C write/read address is 0x80/0x81 0b1000010: I ² C write/read address is 0x84/0x85 0b1000100: I ² C write/read address is 0x88/0x89 0b1100000: I ² C write/read address is 0xC0/0xC1 0b1100010: I ² C write/read address is 0xC4/0xC5 0b1100100: I ² C write/read address is 0xC8/0xC9 0b0100000: I ² C write/read address is 0x40/0x41 0b0100010: I ² C write/read address is 0x44/0x45 ... 0b1111111: I ² C write/read address is 0xFE/0xFF					
CFG_BLOCK	0	Configuration Block When set, all registers become non-writable (read-only). This bit can be used to freeze the chip configuration. The only way to clear this register and regain write access is with a power cycle or toggling the PWDNB pin.			0b0: Not Blocked 0b1: Blocked

Reset	0b0	0b0	0b0	0b0	0b1	0b0	0b1	0b0		
Access Type	Read Only	Read Clears All	Read Clears All	Read Clears All			Write, Read			
BITFIELD	BITS	DESCRIPTION					DECODE			
PCLKDET	7	PCLK detected. This bit is asserted when a pixel clock can be extracted from the video interface receiver and the extracted frequency is measured to be greater than 4MHz. Valid in all video modes. Can also read the following registers to determine if MIPI data is received: phy1_pkt_cnt, csi1_pkt_cnt. In Tunneling mode, can also read tun_pkt_cnt.					0b0: Video received PCLK not detected 0b1: Video received PCLK detected			
DRIFT_ERR	6	VID_TX PCLK drift error detected. After the video pipeline starts, PCLK cannot drift more than a certain amount (+/-1.25%) without restarting the subsystem.					0b0: Video transmit PCLK drift error not detected 0b1: Video transmit PCLK drift error detected			
OVERFLOW	5	VID_TX FIFO has overflowed, video input throughput may be too high, bandwidth allocation on GMSL link for video may not be enough. Pixel mode only.					0b0: Video transmit FIFO has not overflowed 0b1: Video transmit FIFO has overflowed			
FIFO_WARN	4	VID_TX FIFO is more than half full, video data coming from the video interface receiver is read by the scheduler. Pixel mode only.					0b0: Video transmit FIFO is less than or equal to half full 0b1: Video transmit FIFO is more than half full			
LIM_HEART	2	Disable heartbeat during blanking Use together with SEQ_MISS_EN and DIS_PKT_DET bitfields in deserializer.					0b0: Heartbeat enabled during blanking 0b1: Heartbeat disabled during blanking

[VTX0 \(0x24E\)](#)

Used to generate sync signals for the image sensor. Uses reference clock output (derived from XTAL clock) as reference to generate sync signals for the image sensor.

REF_VTG works the same as regular VTG, with the exception of how they are connected internally. VTG uses the input pixel clock as the clock source, and HS, VS, DE signals generated can replace the HS, VS, DE signals received in the input video.

REF_VTG uses the REFGEN_PLL output as the clock source. REFGEN_PLL is a DPLL that uses XTAL clock as the clock source. It can be programmed to generate any PCLK frequency. PCLK generated by REFGEN_PLL (RCLK in pin description) and HS, VS, DE generated by REF_VTG are synchronous to RCLK and output from MFP pins, when enabled. These are then used by the image sensor, which drives the CSI-2 input of the serializer.

BIT	7	6	5	4	3	2	1	0

HS_INV	3	Invert HSYNC output of video-timing generator	0b0: Do not invert HS 0b1: Invert HS
DE_INV	2	Invert DE output of video-timing generator	0b0: Do not invert DE 0b1: Invert DE

BITFIELD	BITS	DESCRIPTION	DECODE
VTG_MODE	1:0	<p>Video interface timing-generation mode. Used when VTG GEN_VS, GEN_HS, or GEN_DE are enabled.</p> <p>00 = VS tracking mode. VS input's period (VS_HIGH + VS_LOW) is tracked. After VS tracking is locked, any VS input edge (glitches) not in the expected PCLK cycle is ignored. VS tracking is locked with three consecutive matches and unlocked by three consecutive mismatches. When unlocked or powered up, the next VS input edge is assumed to be the right VS edge.</p> <p>01 = VS one-trigger mode (default) One VS input edge triggers the generation of one frame of VS/HS/DE output. If the next VS input edge comes earlier or later than expected by VS period, the newly generated frame is correct. The current VS/HS/DE output is cut or extended at the time point of the rising edge of the newly generated VS/HS/DE output.</p> <p>10 = Auto-repeat mode VS input edge triggers the generation of continuous frames of VS/HS/DE output even if no more VS input edges are seen. If the next VS input edge comes earlier or later than expected by VS period, the newly generated frame is correct. The current VS/HS/DE output is cut or extended at the time point of the rising edge of the newly generated VS/HS/DE output.</p>	<p>0b00: VS tracking mode 0b01: VS one trigger mode 0b10: Auto-repeat mode 0b11: Free running mode</p>

BIT	7	6	5	4	3	2	1	0
Field	SERIAL_NUMBER_20[7:0]							
Reset	0x00							
Access Type	Read Only							
BITFIELD	BITS		DESCRIPTION					
SERIAL_NUMBER_20	7:0		Serial Number. Can only be read through the deserializer across the GMSL link.					

[EFUSE101 \(0x1C65\)](#)

BIT	7	6	5	4	3	2	1	0
Field	SERIAL_NUMBER_21[7:0]							
Reset	0x00							
Access Type	Read Only							
BITFIELD	BITS		DESCRIPTION					
SERIAL_NUMBER_21	7:0		Serial Number. Can only be read through the deserializer across the GMSL link.					

[EFUSE102 \(0x1C66\)](#)

BIT	7	6	5	4	3	2	1	0
Field	SERIAL_NUMBER_22[7:0]							
Reset	0x00							
Access Type	Read Only							
BITFIELD	BITS		DESCRIPTION					
SERIAL_NUMBER_22	7:0		Serial Number. Can only be read through the deserializer across the GMSL link.					

[EFUSE103 \(0x1C67\)](#)

BIT	7	6	5	4	3	2	1	0
Field	SERIAL_NUMBER_23[7:0]							
Reset	0x00							
Access Type	Read Only							
BITFIELD	BITS		DESCRIPTION					
SERIAL_NUMBER_23	7:0		Serial Number. Can only be read through the deserializer across the GMSL link.					

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	10/21	Initial release	—
1	3/23	Added maximum supply noise specs for VDD	19
		Updated bandwidth calculations equation	33
		Hid OUT_TYPE for dedicated I2C pins in register map	101, 103
		Removed line fault register decode	59
		Updated TYP lock time spec to 45ms, updated link lock section	11, 32-33
		Updated device reset section. Added a note about one shot reset and removed sleep mode note	38-39
		Updated verbiage in tunneling and pixel mode section	41-42
		Removed sleep mode from the body of DS and register map	38, 60
		Added comment about using a 1M Ohm resistor to GND on ERRB pin	39
		Removed comment about supporting GPIO transitions of 1MHz.	35-36
		Unhid DIS_LOCAL_CC & DIS_Rem_CC register bitfields	58
		Added comment about ADI supplying PMIC devices to pair with MAX96717R	39
		Updated verbiage on Note 2 under EC table	14
		Moved ESD table out of the EC table	20
		Updated thermal guidance verbiage "in still air"	8
		Added "*" to some default MFP pin functions	17
		Updated MIPI speed verbiage to stay consistent to 600Mbps max	26, 42
		Updated DS verbiage and register decode to state only 4 lanes is supported	42, 110
		Updated SION pin description verbiage	16
		Removed external clock EC table	13
2	5/25	Moved sections for better understanding. Corrected grammatical, formats/styles, and spelling.	Many
		Top Marking = MAXIM column removed from Ordering Information table.	45
		Corrected typo in CAP_VDD absolute maximum rating (0.3 to 1.2V changed to -0.3 to 1.2 V).	8
		Updated figure numbers and formatting for Typical Operating Characteristics curves.	15
		Removed Video Timing Generator (VTG) from text and MFP table.	17, 29, 39-40
		SSC PPM value corrected from ± 1250 to ± 1265 PPM.	40
		Added statement in minimum blanking section suggesting use of the GMSL GUI bandwidth calculator.	37
		Updated Coax PoC layout example figure with differential 100 ohm length-matched traces for SION and SIOP.	42
		Corrected description of number of MFP pins available.	34-35
		Changed wording in Minimum Blanking Section ("blanking period" to "sync width").	37
		Removed TX_Rate options that do not apply in register 0x01 description.	57
		Corrected Access Type description for some bits in registers 0x10 and 0x1D.	59, 62
		Corrected details of default settings for MFP1 and MFP2, MFP7, and MFP8.	17, 39
		Added description of Unique Serial Number feature.	42
		Added statement about register 0x302 in Programming Notes section.	43

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
		Register 0x344 decode updated for unsupported data type case.	115
		Updated description of bit 5 in register 0x112 to clarify that it is only applicable in pixel mode.	75
		Updated Typical Application Circuit to show pull-up resistors for I2C/UART.	44
		Unhid some or all bits in registers 0x02, 0x03, 0x07, 0x0F, 0x88, 0x8B, 0x8E, 0x8F, 0x2C0, 0x2C9, 0x2CC, 0x2CF, 0x2D2, 0x2D5, 0x2D8, 0x337, 0x1403, 0x1484, 0x1485, 0x1495, 0x14A8, 0x14A9, 0x14BA, 0x14C8, 0x14C9, 0x14CA, and 0x1A03.	Many
		Hid registers 0x3F1-0x3F3.	54, 124
3	6/25	Corrected typo in ordering information table	45
