The LT®3593 is a step-up DC/DC converter designed to drive up to ten white LEDs in series from a Li-Ion cell. Series connection of the LEDs provides identical LED currents and eliminates the need for ballast resistors. The device features a unique high side LED current sense that enables the part to function as a “one wire current source” where the low side of the LED string can be returned to ground anywhere.

Additional features include output disconnect in shutdown, open LED protection and 1-pin shutdown/LED current control. The CTRL pin is toggled to adjust the LED current via an internal counter and a 5-bit DAC.

The LT3593 switches at 1MHz, allowing the use of tiny external components. Constant frequency switching results in low input noise and a small output capacitor. The LT3593 is available in the 6-lead DFN (2mm × 2mm × 0.75mm) as well as the 6-lead SOT-23 packages.

**PIN FUNCTIONS** (DFN/TSOT)

**VIN (Pin 1/Pin 3):** Input Supply Pin. Must be locally bypassed with a 1μF X5R or X7R type ceramic capacitor.

**GND (Pin 2/Pin 2):** Ground Pin. Connect directly to local ground plane.

**SW (Pin 6/Pin 4):** Switch Pin. Connect inductor between this pin and the VIN pin. Minimize inductance at this pin to minimize EMI.

**CAP (Pin 5/Pin 5):** Output Pin. Connect to output capacitor. Minimize trace between this pin and output capacitor to reduce EMI.

**CTRL (Pin 3/Pin 1):** Current Control and Shutdown Pin. This pin is used to program the LED output current. This pin is strobed up to 32 times to decrement the internal 5-bit DACs from full-scale to 1LSB. The counter will stop at 1LSB if the strobing continues beyond 32 counts.

The pin must be held high after the final desired positive strobe edge. The data is transferred after a 128μs (typ) delay. The part can be reprogrammed to a different value after it has been enabled, however the current will change to the new value after 128μs. If CTRL is held low for longer than 128μs (typ), the part will go into shutdown.

**LED (Pin 4/Pin 6):** LED Pin. An internal switch connects this pin to CAP. The top of the LED string is connected to this pin. When the part is in shutdown, the LED pin is switched off from CAP so no current runs through the LEDs. The switch is also used to sense the LED current when the part is on.

**Exposed Pad (Pin 7/NA):** Ground. The Exposed Pad must be soldered to the PCB.

---

**BLOCK DIAGRAM**

PIN NUMBERS REFER TO DFN PACKAGE. REFER TO PIN CONFIGURATION FOR TSOT PIN NUMBERS

**Figure 1. Block Diagram**
**OPERATION**

The LT3593 uses a constant frequency, current mode control boost scheme to provide excellent line and load regulation. Operation can be best understood by referring to the Block Diagram in Figure 1.

**Output Disconnect**

An internal switch connects between the CAP pin and the LED pin. The top of the LED string is connected to the LED pin. The string can be terminated to ground or to $V_{IN}$ if a low number of LEDs are driven. When the part is in shutdown, the switch is off; allowing no current to run through the LEDs.

**Current Programming**

The LED current can be set to 32 different values ($625μA – 20mA$) by strobing the CTRL pin. A 5-bit counter is decremented by 1 on a CTRL pin rising edge, reducing the programmed current by $625μA$ each time.

The desired current can be calculated by:

$$I_{LED} = 20mA - (N - 1) \cdot 625μA$$

where $N$ is the number of rising edges. When the desired current setting is reached, the CTRL pin must stay high. 128μs after the last rising edge on the CTRL pin, the regulator will enable the output and start to regulate the LED current to the programmed value. Figure 2 shows an example of how the part can be programmed.

If a different current is desired, the CTRL pin can be strobed again. The first falling edge will reset the internal register to the 20mA setting. While the new current is being programmed, the device will continue to regulate the previously programmed value until the CTRL pin has remained high for at least 128μs, at which time the regulated current will slew to the newly programmed value. Figure 3 shows how to program a new LED current level.

If the CTRL pin is held low for longer than 128μs, the part will go into the shutdown mode.

LT3593

APPLICATIONS INFORMATION

Inductor Selection

A 10μH inductor is recommended for most LT3593 applications. Although small size and high efficiency are major concerns, the inductor should have low core losses at 1MHz and low DCR (copper wire resistance). Some inductors in this category with small size are listed in Table 1. The efficiency comparison of different inductors is shown in Figure 4.

Diode Selection

Schottky diodes, with their low forward voltage drop and fast reverse recovery, are the ideal choices for LT3593 applications. The forward voltage drop of a Schottky diode represents the conduction losses in the diode, while the diode capacitance (C_T or C_D) represents the switching losses. For diode selection, both forward voltage drop and diode capacitance need to be considered. Schottky diodes with higher current ratings usually have lower forward voltage drop and larger diode capacitance, which can cause significant switching losses at the 1.0MHz switching frequency of the LT3593. A Schottky diode rated at 400mA to 500mA is sufficient for most LT3593 applications. Some recommended Schottky diodes are listed in Table 3.

<tr>
<td>PSEG-4005A</td>
<td>Phillips</td>
</tr>
</tbody>
</table>

Capacitor Selection

The small size of ceramic capacitors makes them ideal for LT3593 applications. Use only X5R and X7R types because they retain their capacitance over wider voltage and temperature ranges than other types such as Y5V or Z5U. A 1μF input capacitor and a 1μF output capacitor are sufficient for most applications.
APPLICATIONS INFORMATION

Overvoltage Protection

The LT3593 has an internal open-circuit protection circuit. In the case of an output open circuit, when the LEDs are disconnected from the circuit or the LEDs fail open, V_{CAP} is clamped at 38V. The LT3593 will then switch at a very low frequency to minimize input current. V_{CAP} and input current during output open circuit are shown in the Typical Performance Characteristics. Figure 5 shows the transient response when the LEDs are disconnected.

Low Input Voltage Applications

The LT3593 can be used in low input voltage applications. The input supply voltage to the LT3593 must be 2.7V or higher, but the inductor can be run off a lower battery voltage. This technique allows the LEDs to be powered off two alkaline cells. Most portable devices have a 3.3V logic supply voltage which can be used to power the LT3593. The LEDs can be driven straight from the battery, resulting in higher efficiency.

Figure 6 shows three LEDs powered by two AA cells. The battery is connected to the inductors and the chip is powered off a 3.3V logic supply voltage.

![Figure 5. Output Open-Circuit Waveform](image1)

![Figure 6. Two AA Cells to Three White LEDs](image2)
APPLICATIONS INFORMATION

Board Layout Considerations

As with all switching regulators, careful attention must be paid to the PCB layout and component placement. To prevent electromagnetic interference (EMI) problems, proper layout of high frequency switching paths is essential. Minimize the length and area of all traces connected to the switching node pin (SW). Keep the sense voltage pins (CAP and LED) away from the switching node. Place C2 next to the CAP pin. Always use a ground plane under the switching regulator to minimize interplane coupling. Recommended component placement is shown in Figure 7.

Figure 7. Recommended Component Placement
