The LTC®4555 provides power conversion and signal level shifting needed for low voltage 2.5G and 3G cellular telephones to interface with 1.8V or 3V subscriber identity modules (SIMs). The part meets all type approval requirements for 1.8V and 3V SIMs and smart cards. The part contains an LDO linear regulator to supply SIM power at either 1.8V or 3V from a 3V to 6V input. The output voltage is selected with a single pin and up to 50mA of load current can be supplied.

Internal level translators allow controllers operating with supplies as low as 1.2V to interface with 1.8V or 3V smart cards. Battery life is maximized by 20µA operating current and <1µA shutdown current. Board area is minimized by the 3mm × 3mm leadless QFN package.

Features:
- SIM Power Supply: 1.8V/3V at 50mA
- Input Voltage Range: 3V to 6V
- Controller Voltage Range: 1.2V to 4.4V
- 14kV ESD On All SIM Contact Pins
- Meets All ETSI, IMT-2000 and ISO7816 SIM/Smart Card Interface Requirements
- Level Translators to 1.8V or 3V
- 20µA Operating Current
- Logic-Controlled Shutdown (I_{SD} < 1µA)
- Available in a Low Profile, 16-Pin (3mm × 3mm) QFN Package

Applications:
- SIM Interface in 3G Cellular Telephones
- Smart Card Readers

Typical SIM Interface

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** The LTC4555E is guaranteed to meet performance specifications from 0°C to 85°C. Specifications over the −40°C to 85°C operating temperature range are assured by design, characterization and correlation with statistical process controls.

**Note 3:** Specification is guaranteed by design and not 100% tested in production.
**PIN FUNCTIONS**

**SHDN (Pin 1):** Controller Driven Shutdown Pin. This pin should be high (DVCC) for normal operation and low to activate a low current shutdown mode.

**VSEL (Pin 2):** VCC Voltage Select Pin. A low level selects VCC = 1.8V while driving this pin to DVCC selects VCC = 3V.

**DVCC (Pin 3):** Supply Voltage for the Controller Side I/O Pins (CIN, RIN, DATA). When below 1.1V, the VCC supply is disabled. This pin should be bypassed with a 0.1µF ceramic capacitor close to the pin.

**NC (Pins 4, 6, 12, 16):** No Connect.

**VBAT (Pin 5):** VCC Supply Input. This pin can be between 3V and 6V for normal operation. VBAT quiescent current reduces to <1µA in shutdown. This pin should be bypassed with a 0.1µF ceramic capacitor close to the pin.

**VCC (Pin 7):** SIM Card VCC Supply. A 1µF low ESR capacitor needs to be connected close to the VCC pin for stable operation. This pin is discharged to GND during shutdown.

**I/O (Pin 8):** SIM-Side Data I/O. The SIM card output must be on an open-drain driver capable of sourcing >1mA.

**RST (Pin 9):** Reset Output Pin for the SIM Card.

**GND (Pin 10):** Ground for the SIM and Controller. Proper grounding and bypassing is required to meet 14kV ESD specifications.

**CLK (Pin 11):** Clock Output Pin for the SIM Card. This pin is pulled to ground during shutdown. Fast rising and falling edges necessitate careful board layout for the CLK node.

**CIN (Pin 13):** Clock Input from the Controller.

**RIN (Pin 14):** Reset Input from the Controller.

**DATA (Pin 15):** Controller Side Data I/O. This pin is used for bidirectional data transfer. The controller output must be an open-drain configuration. The open-drain output must be capable of sinking greater than 1mA.

**Exposed Pad (Pin 17):** GND. Must be soldered to PCB.
The LTC4555 provides both regulated power and internal level translators to allow low voltage controllers to interface with 1.8V or 3V SIMs or smart cards. The part meets all ETSI, IMT-2000 and ISO7816 requirements for SIM and smart card interfaces.

**VCC Voltage Regulator**

The VCC voltage regulator is a 50mA low dropout (LDO) regulator with a digitally selected 1.8V or 3V output.

The output voltage is selected via the VSEL pin. The output is internally current limited and is capable of surviving an indefinite short to GND.

The VCC output should be bypassed with a 1µF capacitor. The LTC4555 can use either a low ESR ceramic capacitor or a tantalum electrolytic capacitor on the VCC pin, with no special ESR requirements.

V_{BAT} should be bypassed with a 0.1µF ceramic capacitor.

**Level Translators**

All SIMs and smart cards contain a clock input, a reset input and a bidirectional data input/output. The LTC4555 provides level translators to allow controllers to communicate with the SIM. The CLK and RST lines to the SIM are level shifted from the controller supply (GND to DVCC) to the SIM supply (GND to VCC). The data input to the SIM requires an open-drain output on the controller. On-chip pull-up resistors are provided for both the DATA and I/O lines.

**Shutdown Modes**

The LTC4555 enters a low current shutdown mode by pulling the SHDN pin low. The SHDN pin is an active low input that the controller can use to directly shut down the part.

**ESD Protection**

All pins that connect to the SIM/smart card will withstand 14kV of human body model ESD. In order to ensure proper ESD protection, careful board layout is required. The GND pin should be tied directly to a GND plane. The VCC capacitor should be located very close to the VCC pin and tied directly to the GND plane.
LTC4555

PACKAGE DESCRIPTION

Please refer to http://www.linear.com/product/LTC4555#packaging for the most recent package drawings.

UD Package
16-Lead Plastic QFN (3mm × 3mm)
(Reference LTC DWG # 05-08-1691 Rev 0)

NOTE:
1. DRAWING CONFORMS TO JEDEC PACKAGE OUTLINE MO-220 VARIATION (WEED-2)
2. DRAWING NOT TO SCALE
3. ALL DIMENSIONS ARE IN MILLIMETERS
4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15mm ON ANY SIDE
5. EXPOSED PAD SHALL BE SOLDER PLATED
6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE
