LT1226
Low Noise Very High Speed Operational Amplifier

FEATURES
- Gain of 25 Stable
- 1GHz Gain Bandwidth
- 400V/µs Slew Rate
- 2.6nV/√Hz Input Noise Voltage
- 50V/mV Minimum DC Gain, R_L = 500Ω
- 1mV Maximum Input Offset Voltage
- ±12V Minimum Output Swing into 500Ω
- Wide Supply Range ±2.5V to ±15V
- 7mA Supply Current
- 100ns Settling Time to 0.1%, 10V Step
- Drives All Capacitive Loads

APPLICATIONS
- Wideband Amplifiers
- Buffers
- Active Filters
- Video and RF Amplification
- Cable Drivers
- Data Acquisition Systems

DESCRIPTION
The LT1226 is a low noise, very high speed operational amplifier with excellent DC performance. The LT1226 features low input offset voltage and high DC gain. The circuit is a single gain stage with outstanding settling characteristics. The fast settling time makes the circuit an ideal choice for data acquisition systems. The output is capable of driving a 500Ω load to ±12V with ±15V supplies and a 150Ω load to ±3V on ±5V supplies. The circuit is also capable of driving large capacitive loads which makes it useful in buffer or cable driver applications.

The LT1226 is a member of a family of fast, high-performance amplifiers that employ Linear Technology Corporation’s advanced bipolar complementary processing.

TYPICAL APPLICATION
Photodiode Preamplifier, A_V = 5.1kΩ, BW = 15MHz

Gain of +25 Pulse Response
### Absolute Maximum Ratings

- Total Supply Voltage ($V^+ \text{ to } V^-$) ............. 36V
- Differential Input Voltage ........................................ $\pm 6V$
- Input Voltage .................................................... $\pm V_S$
- Output Short Circuit Duration (Note 1) .......... Indefinite
- Operating Temperature Range
  - LT1226C .................................................. $0^\circ C \text{ to } 70^\circ C$
- Maximum Junction Temperature
  - Plastic Package .............................................. $150^\circ C$
- Storage Temperature Range ................. $-65^\circ C \text{ to } 150^\circ C$
- Lead Temperature (Soldering, 10 sec.) .......... $300^\circ C$

### Electrical Characteristics

**$V_S = \pm 15V$, $T_A = 25^\circ C$, $V_{CM} = 0V$ unless otherwise noted.**

</table>

**Note 1:** A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted indefinitely.

**Note 2:** Input offset voltage is tested with automated test equipment in <1 second.

**Note 3:** Slew rate is measured between ±10V on an output swing of ±12V on ±15V supplies, and ±2V on an output swing of ±3.5V on ±5V supplies.

**Note 4:** Full power bandwidth is calculated from the slew rate measurement: FPBW = SR/2πVp.
**Input Common Mode Range vs Supply Voltage**

- $T_A = 25°C$
- $\Delta V_{OS} < 1mV$

**Supply Current vs Supply Voltage**

- $T_A = 25°C$

**Output Voltage Swing vs Supply Voltage**

- $T_A = 25°C$
- $R_L = 500\Omega$
- $\Delta V_{OS} = 30mV$

**Output Voltage Swing vs Resistive Load**

- $T_A = 25°C$
- $\Delta V_{OS} = 30mV$

**Input Bias Current vs Input Common Mode Voltage**

- $V_S = \pm 15V$
- $T_A = 25°C$
- $I_B = \frac{V_{CM} + V_{CM}}{2}$

**Open Loop Gain vs Resistive Load**

- $T_A = 25°C$
- $V_S = \pm 15V$

**Supply Current vs Temperature**

- $V_S = \pm 15V$

**Input Bias Current vs Temperature**

- $V_S = \pm 15V$
- $I_B = \frac{V_{LS} + V_{LS}}{2}$

**Output Short Circuit Current vs Temperature**

- $V_S = \pm 5V$
The LT1226 may be inserted directly into HA2541, HA2544, AD847, EL2020 and LM6361 applications, provided that the amplifier configuration is a noise gain of 25 or greater, and the nulling circuitry is removed. The suggested nulling circuit for the LT1226 is shown below.

### Layout and Passive Components

As with any high speed operational amplifier, care must be taken in board layout in order to obtain maximum performance. Key layout issues include: use of a ground plane, minimization of stray capacitance at the input pins, short lead lengths, RF-quality bypass capacitors located close to the device (typically 0.01\(\mu\)F to 0.1\(\mu\)F), and use of low ESR bypass capacitors for high drive current applications (typically 1\(\mu\)F to 10\(\mu\)F tantalum). Sockets should be avoided when maximum frequency performance is required, although low profile sockets can provide reasonable performance up to 50MHz. For more details see Design Note 50. Feedback resistors greater than 5k\(\Omega\) are not recommended because a pole is formed with the input capacitance which can cause peaking. If feedback resistors greater than 5k\(\Omega\) are used, a parallel capacitor of 5pF to 10pF should be used to cancel the input pole and optimize dynamic performance.

### Transient Response

The LT1226 gain bandwidth is 1GHz when measured at 1MHz. The actual frequency response in a gain of +25 is considerably higher than 40MHz due to peaking caused by a second pole beyond the gain of 25 crossover point. This is reflected in the small signal transient response. Higher noise gain configurations exhibit less overshoot as seen in the inverting gain of 25 response.

### Input Considerations

Resistors in series with the inputs are recommended for the LT1226 in applications where the differential input voltage exceeds ±6V continuously or on a transient basis. An example would be in noninverting configurations with high input slew rates or when driving heavy capacitive loads. The use of balanced source resistance at each input is recommended for applications where DC accuracy must be maximized.

### Capacitive Loading

The LT1226 is stable with all capacitive loads. This is accomplished by sensing the load induced output pole and adding compensation at the amplifier gain node. As the capacitive load increases, both the bandwidth and phase margin decrease so there will be peaking in the
**APPLICATIONS INFORMATION**

Frequency domain and in the transient response. The photo of the small signal response with 1000pF load shows 55% peaking. The large signal response with a 10,000pF load shows the output slew rate being limited by the short circuit current.

\[
\begin{align*}
A_V &= -25, \ C_L = 1000pF \\
A_V &= +25, \ C_L = 10,000pF
\end{align*}
\]

The LT1226 can drive coaxial cable directly, but for best pulse fidelity the cable should be doubly terminated with a resistor in series with the output.

**Compensation**

The LT1226 has a typical gain bandwidth product of 1GHz which allows it to have wide bandwidth in high gain configurations (i.e., in a gain of 1000 it will have a bandwidth of about 1MHz). The amplifier is stable in a noise gain of 25 so the ratio of the output signal to the inverting input must be 1/25 or less. Straightforward gain configurations of +25 or –24 are stable, but there are a few configurations that allow the amplifier to be stable for lower signal gains (the noise gain, however, remains 25 or more). One example is the inverting amplifier shown in the typical applications sections below. The input signal has a gain of \(-R_F/R_{IN}\) to the output, but it is easily seen that this configuration is equivalent to a gain of –24 as far as the amplifier is concerned. Lag compensation can also be used to give a low frequency gain less than 25 with a high frequency gain of 25 or greater. The example below has a DC gain of 6, but an AC gain of +31. The break frequency of the RC combination across the amplifier inputs should be at least a factor of 10 less than the gain bandwidth of the amplifier divided by the high frequency gain (in this case 1/10 of 1GHz/31 or 3MHz).

**TYPICAL APPLICATIONS**

**Lag Compensation**

\[
\begin{align*}
V_{IN} &\rightarrow 200\Omega \\
&\rightarrow 330pF \\
&\rightarrow 5k \\
&\rightarrow 1k \\
\end{align*}
\]

\[
A_V = +6, \ f < 2MHz
\]

**Compensation for Lower Closed-Loop Gains**

\[
\begin{align*}
V_{IN} &\rightarrow R_F \\
&\rightarrow R_{IN} \\
&\rightarrow R_C \\
\end{align*}
\]

\[
A_V = -\frac{R_F}{R_{IN}} ; R_F \geq 24 \times (R_{IN} \parallel R_C)
\]

**Cable Driving**

\[
\begin{align*}
V_{IN} &\rightarrow LT1226 \\
&\rightarrow R_1 = 1.2k \\
&\rightarrow R_2 = 50\Omega \\
&\rightarrow R_3 = 75\Omega \ CABLE \\
&\rightarrow R_4 = 75\Omega \\
\end{align*}
\]

**VOS Null Loop**

\[
\begin{align*}
V_{IN} &\rightarrow 300k \\
&\rightarrow 300k \\
&\rightarrow 8 \\
&\rightarrow 25k \\
&\rightarrow 25\Omega \\
\end{align*}
\]

\[
A_V = 1001
\]
