
5V, CMOS, Zero-Drift, Rail-to-Rail, Dual Operational Amplifier

FEATURES

- ▶ **Unity gain stable**
- ▶ **Low offset voltage: 1 μ V**
- ▶ **Input offset drift: 5nV/ $^{\circ}$ C**
- ▶ **Gain Bandwidth: 2.5MHz**
- ▶ **Rail-to-rail input and output swing**
- ▶ **5V single-supply operation**
- ▶ **High gain and CMRR: 150dB**
- ▶ **High PSRR: 120dB**
- ▶ **Very low input bias current: 150pA maximum**
- ▶ **Low supply current: 800 μ A**
- ▶ **Overload recovery time: 50 μ s**
- ▶ **No phase reversal**

APPLICATIONS

- ▶ **Pressure and position sensors**
- ▶ **Strain gage amplifiers**
- ▶ **Medical instrumentation**
- ▶ **Thermocouple amplifiers**
- ▶ **Precision current sensing**
- ▶ **Photodiode amplifiers**

GENERAL DESCRIPTION

The MAX74811 is a wide bandwidth auto-zero amplifier featuring rail-to-rail input and output swing and low noise. 5V single supply operation is specified.

The MAX74811 zero-drift amplifier combines low cost with high accuracy and low noise. In addition, the MAX74811 greatly reduces the digital switching noise found in most chopper-stabilized amplifiers.

With an offset voltage of only 1 μ V (typ), drift of 5nV/ $^{\circ}$ C (typ), and noise of only 0.5 μ V p-p (0.1Hz to 10Hz) (typ), the MAX74811 is suited for applications where error sources cannot be tolerated. Position and pressure sensors, medical equipment, and strain gauge amplifiers benefit greatly from nearly zero drift over their operating temperature range. Many systems can take advantage of the rail-to-rail input and output swings provided by the MAX74811 to reduce input biasing complexity and maximize signal-to-noise ratio (SNR).

The MAX74811 is specified for the extended industrial temperature range (-40° C to $+125^{\circ}$ C). The MAX74811 is available in the standard 8-lead MSOP plastic package.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ C$ unless otherwise specified.

Table 2. Absolute Maximum Ratings

PARAMETER	RATING
Supply Voltage	6V
Input Voltage	GND – 0.3V to $V_S + 0.3V$
Differential Input Voltage ¹	$\pm 5V$
Input Current (Indefinite)	$\pm 10mA$
Input Current (Duration < 1 sec)	$\pm 100mA$
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	$-65^\circ C$ to $+150^\circ C$
Operating Temperature Range	$-40^\circ C$ to $+125^\circ C$
Junction Temperature Range	$-65^\circ C$ to $+150^\circ C$
Lead Temperature (Soldering, 60 sec.)	$300^\circ C$
ESD MM	$\pm 200V$
ESD HBM	$\pm 4000V$
ESD FICDM 8-Lead MSOP	$\pm 1500V$

¹ Differential input voltage is limited to $\pm 5V$ or the supply voltage, whichever is less.

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Thermal Characteristics

θ_{JA} is specified for worst-case conditions, that is, θ_{JA} is specified for the device soldered in a circuit board for surface-mount packages. This was measured using a standard two-layer board.

Table 3. Package Type

PACKAGE TYPE	θ_{JA}	θ_{JC}	UNIT
8-Lead MSOP (RM-8)	190	44	°C/W

ESD Caution

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

FUNCTIONAL DESCRIPTION

The MAX74811 is a single-supply, ultrahigh precision rail-to-rail input and output operational amplifier. The typical offset voltage of less than $1\mu\text{V}$ allows this amplifier to be easily configured for high gains without risk of excessive output voltage errors. The extremely small temperature drift of $5\text{nV}/^\circ\text{C}$ ensures a minimum offset voltage error over its entire temperature range of -40°C to $+125^\circ\text{C}$, making this amplifier ideal for a variety of sensitive measurement applications in harsh operating environments.

The MAX74811 achieves a high degree of precision through a patented combination of auto-zeroing and chopping. This unique topology allows the MAX74811 to maintain its low offset voltage over a wide temperature range and over its operating lifetime.

Previous designs used either auto-zeroing or chopping to add precision to the specifications of an amplifier. Auto-zeroing results in low noise energy at the auto-zeroing frequency, at the expense of higher low frequency noise due to aliasing of wideband noise into the auto-zeroed frequency band. Chopping results in lower low frequency noise at the expense of larger noise energy at the chopping frequency. The MAX74811 uses both auto-zeroing and chopping in a patented ping-pong arrangement to obtain lower low frequency noise together with lower energy at the chopping and auto-zeroing frequencies, maximizing the signal-to-noise ratio for the majority of applications without the need for additional filtering.

The MAX74811 has low noise over a relatively wide bandwidth (0Hz to 10kHz) and can be used where the highest DC precision is required. In systems with signal bandwidths from 5kHz to 10kHz, the MAX74811 provides true 16-bit accuracy, making it the best choice for very high-resolution systems.

1/f Noise

1/f noise, also known as pink noise, is a major contributor to errors in DC-coupled measurements. This 1/f noise error term can be in the range of several μV or more, and, when amplified with the closed-loop gain of the circuit, can show up as a large output offset. For example, when an amplifier with a $5\mu\text{V}$ p-p 1/f noise is configured for a gain of 1000, its output has 5mV of error due to the 1/f noise. However, the MAX74811 eliminates 1/f noise internally, thereby greatly reducing output errors.

The internal elimination of 1/f noise is accomplished as follows. 1/f noise appears as a slowly varying offset to the MAX74811 inputs. Auto-zeroing corrects any DC or low frequency offset. Therefore, the 1/f noise component is essentially removed, leaving the MAX74811 free of 1/f noise.

For a first-order filter, the total integrated noise from the MAX74811 is lower than the noise of Competitor A.
