How to Reproduce the EEMBC Scores for the ADuCM3027/ADuCM3029

INTRODUCTION

This reference manual describes how to reproduce the Embedded Microprocessor Benchmark Consortium (EEMBC) ULPBench™ Core Profile score and the CoreMark® score for the ADuCM3027/ADuCM3029 microcontrollers.

This reference manual describes the steps necessary to install the software and to set up the hardware for measuring both scores. Working through this document brings the user to a stage where they are able to reproduce the EEMBC ULPBench Core Profile score and the CoreMark score in the ADuCM3029 EZ-KIT® board.

This reference manual provides details of the energy consumed by the ADuCM3027/ADuCM3029 microcontroller in the different power modes used on the benchmark, confirming the data sheet power numbers.

ABOUT THE ADuCM3027/ADuCM3029

The ADuCM3027/ADuCM3029 processor is an ultralow power, integrated, mixed-signal microcontroller system used for processing, control, and connectivity. The microcontroller unit (MCU) subsystem is based on the ARM® Cortex™-M3 processor, a collection of digital peripherals, cache embedded SRAM and flash memory, and an analog subsystem, which provides clocking, reset, and power management capabilities along with the analog-to-digital converter (ADC).

The ADuCM3027/ADuCM3029 processor provides a collection of power modes and features, such as dynamic and software controlled clock gating and power gating, to support extremely low dynamic and hibernate power management.

Full specifications on the ADuCM3027/ADuCM3029 are available in the product data sheet. Consult the data sheet in conjunction with this reference manual when working with the EZ-KIT.

REVISION HISTORY

3/2017—Revision 0: Initial Version
ABOUT EEMBC

EEMBC® is a nonprofit industry association that detected the need for a joint, democratic effort involving the leading suppliers in the embedded industry to make new benchmarks a reality.

EEMBC members represent more than 40 of the world's leading semiconductor, intellectual property, compiler, RTOS, and system companies. Furthermore, EEMBC is licensed by more than 80 companies and more than 100 universities worldwide. Through the combined efforts of its members, EEMBC benchmarks have become an industry standard for evaluating the capabilities of embedded processors and systems according to objective, clearly defined, application-based criteria.

EEMBC has benchmark suites targeting cloud and big data, mobiles devices (for phones and tablets), networking, ultralow power microcontrollers, the Internet of Things (IoT), digital media, automotive, and other application areas. EEMBC also has benchmarks for general-purpose performance analysis including CoreMark, MultiBench™ (multicore), and FPMark™ (floating point).

This reference manual focuses on the CoreMark and ultralow power microcontrollers benchmarks, targeted to measure the power processing and the MCU energy efficiency, respectively, because these aspects are key features of the ADuCM3027/ADuCM3029 processor.

COREMARK

To select an MCU for a particular application, the user needs to know if the MCU has enough processing power to meet the requirement. Several benchmarking options are available. Dhrystone is the most widely used benchmarking option; however, it has a few inherit problems such as having library calls within the timed portion and being susceptible to the ability of a compiler to optimize work, among others. To address these problems and to provide a simple, open source benchmark, EEMBC created the CoreMark.

CoreMark is a benchmark that aims to measure the performance of central processing units (CPU) used in embedded systems. It was developed in 2009 at EEMBC and is intended to become an industry standard, replacing the antiquated Dhrystone benchmark. Written in C, the code contains implementations of the following algorithms:

- List processing (find and sort)
- Matrix manipulation (common matrix operations)
- State machine (determine if an input stream contains valid numbers)
- CRC

ULPBENCH

Whether the target is edge nodes for the IoT or any other type of battery-powered application, the implications of ultralow power (ULP) varies. The lowest active current is required when the power source is severely limited (for example, energy harvesting). The lowest sleep current is required when the system spends most of its time in standby or sleep mode, waking up infrequently (periodically or asynchronously) to process a task. ULP can also imply great energy efficiency, whereby the most work is performed in a limited time period. Overall, the application requires a combination of tradeoffs on all of the previously mentioned criteria. To ensure ULP operation over periods of months, years, and decades, application developers face a number of optimization challenges. There are an increasing number of microcontrollers claiming ULP capabilities; however, developers cannot rely on data sheet parameters alone. The EEMBC ULPBench standardizes on data sheet parameters and provides a methodology to reliably and equitably measure MCU energy efficiency.

The foundations of ULPBench are as follows:

- Comparability, to make it easy to compare devices.
- Transparency, to make all measurements and the setup process transparent.
- Reproducibility, to make it easy to for anyone to reproduce the benchmark scores.
IAR SETUP

IAR TOOLS INSTALLATION

The IAR Embedded Workbench and the included IAR C/C++ Compiler generates the fastest performing, most compact code in the industry for ARM-based applications. Therefore, Analog Devices provides the board support package (BSP) for the ADuCM3027/ADuCM3029 for the IAR Workbench.

Support for the ADuCM3027/ADuCM3029 is provided within the BSP.

The KickStart edition is a special starter kit/evaluation version of IAR that is free. This edition has limitations both in code size (32 kB) and in the service and support provided.

The IAR Embedded Workbench can be downloaded from the IAR website.

IAR PROJECT CONFIGURATION

This section describes the IAR configuration for proper operation. Only the sections that need to be modified from the default values are mentioned.

1. Right-click the name of the project and click Options..., as shown in Figure 2.

2. Under General Options, ensure that AnalogDevices ADUCM3027 or AnalogDevices ADUCM3029 is selected as the target, depending on the microcontroller used.

3. Under C/C++ Compiler, ensure that the optimization for high speed is chosen (see Figure 4). Some functions, such as pltInitialize, are protected to ensure that they are not optimized. The following code protects a function and prevents the compiler from modifying the function code:

   #pragma optimize=none

   Figure 3 shows the included directories path and the define settings necessary for a proper compilation of the ULPBench Core Profile project.

Figure 3. General Options—Target Configuration

Figure 4. C/C++ Compiler—Optimizations Configuration
4. A 32-bit cyclic redundancy check (CRC) checksum stored in the Signature field enables user code to request an integrity check of user space. Therefore, it is necessary to configure the checksum as shown in Figure 7 and Figure 8 (both configurations can be found under Linker).

Figure 5. C/C++ Compiler—Preprocessor ULPBench Configuration

Figure 6 shows the included directories path and the define settings necessary for a proper compilation of the CoreMark project.

Figure 6. C/C++ Compiler—Preprocessor CoreMark Configuration

To avoid undesired warnings, add the following diagnostics to the Suppress following diagnostics option: Pa050 and Pa082.

Figure 7. Linker—Checksum Configuration

Figure 8. Linker—Extra Options Configuration
5. The debugger used is J-Link/J-Trace (see Figure 9). Verify that both Verify download and Use flash loader are checked on the Debugger > Download menu, as shown in Figure 10.

6. Figure 11 and Figure 12 show the J-Link/J-Trace configuration. Be sure to use the Halt after bootloader target reset strategy; otherwise, a kernel corruption is incurred, and the device locks down. To recover from device lockdown, the user must reflash the kernel.
COREMARK
LOADING COREMARK PROJECT
The project with the CoreMark source files and the core_portme.c and core_portme.h files are tuned to the Analog Devices platform. The following steps describe how to add the CoreMark project on IAR.

1. Open the IAR workbench.
2. Open the project in IAR.
3. Under Project, click Add Existing Project…, as shown in Figure 13.

4. Browse through the project obtained and open the .ewp extension file. The files available in the workspace are as shown in Figure 14.

The BSP sources folder includes the BSP files for configuring the device properly. The CoreMark sources folder includes the source files given by the EEMBC. The Platform sources folder contains the core_portme.c file given by the EEMBC, but tuned to configure properly the tested device, in this case the ADuCM3027/ADuCM3029 processor.

EEMBC does not restrict on changing the core_portme.c and core_portme.h files to suit the Analog Devices platform. The following are the differences between the core_portme.c file and the one given by the EEMBC:

- Code for UART printing.
- Code for calculating the ticks of execution using an oscillator or crystal.
- Code to configure the microcontroller properly.
- Header files to support these codes.
- Device configuration. Note that the HP buck is enabled to reduce the power consumption, which is useful during power measurement when CoreMark is running (see the Power Measurements section).

The core_portme.h file has two defines:

- UART_PRINT define is used to print the result through the UART. If this is commented, the results are printed only on the terminal input/output.
- XTAL define is used to decide whether measuring the ticks using an external crystal oscillator or the internal RC oscillator. If this is commented, the internal oscillator is used; otherwise, the crystal oscillator is used.

RUNNING THE APPLICATION
Building the Application
To build or compile the application code, take one of the following steps:

- Click Project, then click Rebuild All (as shown in Figure 15).
- Right-click the project name and click Rebuild All, as shown in Figure 16. The user is prompted to save the workspace in an .eww extension. The project must build without any errors.
Figure 16. Building the Project

**Downloading the Code**

To load the code onto the EZ-KIT board, take one of the following steps:

- Under *Project*, click *Download*, then click *Download active application*, as shown in Figure 17.
- Click *Download and Debug*, as shown in Figure 18.

**Running the Project**

To run the code, click *Go*, as shown in Figure 19.

**COREMARK RESULTS**

The requirement is that the CoreMark code must run for at least 10 seconds. The provided code has set up 10,000 iterations, resulting approximately 2 minutes to complete the execution.

The results are printed out on the terminal input/output. To view the terminal input/output, click *View*, then click *Terminal I/O*. Note that it is necessary to be in debug mode for this option to be active.

By default, UART_PRINT define in the core_portme.h file is commented. To print the results through UART, uncomment UART_PRINT define.

The following steps describe how to print the results through UART:

1. Uncomment UART_PRINT define.
2. Connect the UART port of the EZ-KIT to the PC using a USB cable.
3. From the Control Panel, click Device Manager.
4. Check the COM port number to which the UART is connected.
5. Open a terminal that can connect to the UART port (PuTTY is used here).
6. Set the Connection type to Serial, and input the corresponding COM port number.
7. The other settings are as shown in Figure 23.

![Figure 23. UART Configuration](image)

Rebuild the project, following the instructions in the Running the Project section. The results are printed through UART (see Figure 24).

The CoreMark number shows the raw horsepower, and the CoreMark/MHz number shows the efficiency of the core. To calculate the CoreMark/MHz number, the CoreMark number must be divided by the clock speed used when the benchmark is performed.

\[
\text{CoreMark/MHz} = \frac{\text{CoreMark Score}}{\text{Clock Frequency}}
\]

In this project, the ADuCM3027/ADuCM3029 processors runs at 26 MHz.

\[
\text{CoreMark/MHz} = \frac{85.337589}{26} = 3.2822
\]

The CoreMark/MHz score is 3.2822.

This score is almost equal to the CoreMark/MHz score of the ARM Cortex-M3 processor, whose score is 3.32.

To report the score, CoreMark recommends the following format:

```
CoreMark/MHz 1.0: 3.2822 / IAR EWARM
7.50.2.10505 --no_size_constraints
--cpu=Cortex-M3 -D __ADUCM3029__
--no_code_motion -Ohs -e --fpu=None
--endian=little/FLASH
```

**POWER MEASUREMENTS**

The following steps describe how to monitor the current consumption of the ADuCM3027/ADuCM3029 processor when it executes the CoreMark code:

1. Ensure that UART_PRINT define in the core_portme.h file is commented so that the UART pins are not floating.
2. Load the code onto the microcontroller.
3. Connect the positive terminal of the source to the JP6 connector.
4. Connect the GND of the source to the GND of the board.
5. Remove all the jumpers.
6. Press the Reset button.
7. Monitor the current consumption on the meter. The current consumption must be approximately 1165 μA when the processor executes the code at 26 MHz.
8. For dynamic current consumption, repeat the procedure with a different frequency. Change the CLKDIV definition variable to 4 so that the frequency is divided by 4, yielding a value of 26 MHz/4 = 6.5 MHz.
9. Monitor the current consumption on the meter. The current consumption must be approximately 425 μA.

To obtain the dynamic current consumption value, calculate the slope of the line formed by the two points (frequency and current).

The slope is calculated as follows:

\[
\text{Slope} = \frac{1165 - 425}{26 - 6.5} = 38 \mu A/MHz
\]

The dynamic current consumption is 38 μA/MHz.

![Figure 24. Results on UART](image)
ULPBENCH CORE PROFILE
THE ENERGYMONITOR
The EEMBC ULPBench EnergyMonitor™ software is an accurate tool for measuring energy. The EEMBC EnergyMonitor hardware (shown in Figure 25) is needed to measure ULPBench scores. This hardware can be purchased from the EEMBC website.

Figure 25 shows the EEMBC EnergyMonitor hardware, and the VCC and GND pins used to power the ADuCM3029 EZ-KIT board.

Installing the EnergyMonitor Software Drivers
The first time the EnergyMonitor hardware is connected to the PC, a USB driver message appears because it is an unrecognized USB device.

When the USB driver message appears, click Next, and then click Manually locate USB drivers.

If the driver message does not appear, go to the Device Manager and locate the devices named EEMBC Application UART1 and EEMBC Energy Tool V1 to install the driver on each of them.

Install the USB drivers, which are located at /bin/USB_CDC/monitor_driver.inf and /bin/USB_CDC/monitor_driver.cat.
A security warning appears indicating that the publisher cannot be verified. Click Install this driver software anyway.

By default, 64-bit versions of Windows® Vista and later versions of Windows load a kernel mode driver only if the kernel can verify the driver signature. If using one of these versions of Windows, and the drivers cannot be installed, use the appropriate mechanisms to temporarily disable load time enforcement of a valid driver signature (the appropriate mechanism depends on the Windows version).

BUILDING THE APPLICATION CODE
Building the Application
To build or compile the application code, click Project, and then click Rebuild All.

Setting Up the Board to Download the Code
To download the code via USB, both JP6 jumpers must be installed.

If the EEMBC ULPBench_Phase1 project has been downloaded previously, the device is in hibernate mode for the majority of the time while in operation. In deep sleep mode (both hibernate and shutdown modes), the serial wire is disabled and it is not possible to download code.

The EEMBC ULPBench_Phase1 project ensures that the user can download code when the application is in flash by adding the following code:

```c
while((pADI_GPIO0->IN & (1 << 4)) == (0 << 4));
```

At startup, P0.4 is configured as an input. To be able to download the code, it is necessary to clear the P0.4 pin, because the code is waiting in the while loop. To clear the P0.4 pin, shortcut P0.4 (Pin 10 of the Arduino header, J6, labelled as SCL on the silkscreen) and ground (Pin 7 of the Arduino header, J7, labelled as GND on the silkscreen) by placing a cable as shown in Figure 27.
**Downloading the Code**

To download the code, click **Project > Download > Download active application.**

![Download active application](image)

Figure 28. Downloading the Application

After power cycling the device, the code runs on the ADuCM3027/ADuCM3029 device.

**RUNNING THE BENCHMARK**

**Running the ULPBench Core profile**

This section provides a step by step account of how to set up the ADuCM3029 EZ-KIT board for measuring the ULPBench Core Profile score.

1. Remove the cable previously placed between P0.4 and GND (described in the previous section).
2. Place the cable previously removed between P0.4 and VBAT (Pin 4 of the Arduino header, J7, labelled as 3.3 V on the silkscreen). With this configuration, the code does not stop on the `while` instruction (see the Setting Up the Board to Download the Code section).
3. Remove the USB cable.
4. Remove the JTAG.
5. Remove the JP6 jumper between Pin 1 and Pin 3. This is the power measurement jumper.
   - Pin 1 powers the external components of the board (LEDs, switches, sensors, and accelerometers).
   - Pin 3 powers the microcontroller.
7. Connect the GND cable coming from the EnergyMonitor hardware to Pin 7 of J6.

The connection as shown in Figure 30 is now established.

Proceed to measure the score by starting the EnergyMonitor software and clicking **Run ULPBench.** The EnergyMonitor hardware powers the ADuCM3029 EZ-KIT board and measures the energy consumption of the core profile. At the end of the run, the software calculates the EEMBC ULPBench Core Profile score and displays it on screen. The software also displays the average energy consumed for previous cycles in the history window.

![Board Setup for Measuring the Score](image)

Figure 30. Board Setup for Measuring the Score
The score obtained for typical devices is around 250 EEMarks™-CP. This value may vary depending on process and temperature conditions. Figure 31 shows an example of a score for a typical device.

**Verifying the Correct Operation**

To ensure that the workload is being executed correctly, a status pin has been defined. P0.2 (accessible on Pin 5 of J6, labelled as 12 on the silkscreen) is configured as the status pin in the certified code (purple cable shown in Figure 30).

According to the benchmark, the workload is executed twice, and at the beginning, the status pin toggles 20 times. When the second workload finishes, the status pin is cleared unless an error is flagged.

Figure 32 shows the P0.2 output while the workload is executed, as described previously.

**Running the ULP Crystalless Profile**

The Core Profile is the only score currently certified by the ULPBench group. However, an agreement for crystalless score is currently under discussion within the ULPBench working group.

If an application does not require an accuracy as high as the one provided by a crystal, a low frequency oscillator (LFOSC) can be used as the source clock of the real time clock to reduce the energy consumption. Both the LFOSC and LFXTAL frequencies are 32 kHz.

The distributed code includes a define directive (Line 51 of the Platform.c file) to allow testing of the ULPBench Crystalless Profile. Uncomment the define USE_LFOSC line to use the LFOSC as the RTC clock:

```
define USE_LFOSC
```

The score obtained for typical devices is around 265 EEMarks™-CP. This value may vary depending on process and temperature conditions. Figure 33 shows an example of a score for a typical device.

**RESULTS ANALYSIS**

The ULPMark-CP uses a formula that takes the reciprocal of the energy values (median of 5 times the average energy per second for 10 ULPBench cycles).

\[
E_{EEMarkCP} = \frac{1000}{E_{MarkCP}}
\]

The consumed energy is obtained as the sum of the energy consumed while the device is executing the workload (in active mode) and while the device is in hibernate.

\[
Energy = Active\ energy + Sleep\ energy
\]

According to the ADuCM3027/ADuCM3029 data sheet, the typical value for an active current is 38 μA/MHz, and for a hibernate current, 830 nA with LFXTAL and RTC enabled.

Figure 32 shows that the active time duration is 420 μs.

\[
Active\ energy = 3\ V \times 1188\ \mu A \times 0.42\ ms = 1.49\ \mu J
\]

\[
Sleep\ energy = 3\ V \times 830\ \mu A \times 999.58\ ms = 2.49\ \mu J
\]

According to the data sheet numbers and the execution time, the energy for the active current is 1.49 μJ, and the energy consumed during the sleep time is 2.49 μJ. The score according to those values matches the ones measured with the EEMBC EnergyMonitor software.

\[
Energy = 1.49 + 2.49 = 3.98\ \mu J \cong \frac{1000}{252.1} = 3.96\ \mu J
\]
ESD Caution

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Legal Terms and Conditions

By using the evaluation board discussed herein (together with any tools, components documentation or support materials, the "Evaluation Board"), you are agreeing to be bound by the terms and conditions set forth below ("Agreement") unless you have purchased the Evaluation Board, in which case the Analog Devices Standard Terms and Conditions of Sale shall govern. Do not use the Evaluation Board until you have read and agreed to the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. This Agreement is made by and between you ("Customer") and Analog Devices, Inc. ("ADI"), with its principal place of business at One Technology Way, Norwood, MA 02062, USA. Subject to the terms and conditions of the Agreement, ADI hereby grants to Customer a free, limited, personal, non-exclusive, non-sublicensable, non-transferable license to use the Evaluation Board FOR EVALUATION PURPOSES ONLY. Customer understands and agrees that the Evaluation Board is provided for the sole and exclusive purpose referenced above, and agrees not to use the Evaluation Board for any other purpose. Furthermore, the license granted is expressly made subject to the following additional limitations: Customer shall not (i) rent, lease, display, sell, transfer, assign, sublicense, or distribute the Evaluation Board; and (ii) permit any Third Party to access the Evaluation Board. As used herein, the term "Third Party" includes any entity other than ADI, Customer, their employees, affiliates and in-house consultants. The Evaluation Board is NOT sold to Customer; all rights not expressly granted herein, including ownership of the Evaluation Board, are reserved by ADI. CONFIDENTIALITY. This Agreement and the Evaluation Board shall all be considered the confidential and proprietary information of ADI. Customer may not disclose or transfer any portion of the Evaluation Board to any other party for any reason. Upon discontinuation of use of the Evaluation Board or termination of this Agreement, Customer agrees to promptly return the Evaluation Board to ADI. ADDITIONAL RESTRICTIONS. Customer may not disassemble, decompile or reverse engineer chips on the Evaluation Board. Customer shall inform ADI of any occurred damages or any modifications or alterations it makes to the Evaluation Board, including but not limited to soldering or any other activity that affects the material content of the Evaluation Board. Modifications to the Evaluation Board must comply with applicable law, including but not limited to the RoHS Directive. TERMINATION. ADI may terminate this Agreement at any time upon giving written notice to Customer. Customer agrees to promptly return the Evaluation Board to ADI. LIMITATION OF LIABILITY. THE EVALUATION BOARD PROVIDED HEREUNDER IS PROVIDED "AS IS" AND ADI MAKES NO WARRANTIES OR REPRESENTATIONS OF ANY KIND WITH RESPECT TO IT. ADI SPECIFICALLY DISCLAIMS ANY REPRESENTATIONS, ENDORSEMENTS, GUARANTEES, OR WARRANTIES, EXPRESS OR IMPLIED, RELATED TO THE EVALUATION BOARD INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTY OF MERCHANTABILITY, TITLE, FITNESS FOR A PARTICULAR PURPOSE OR NONINFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS. IN NO EVENT WILL ADI AND ITS LICENSORS BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES RESULTING FROM CUSTOMER’S POSSESSION OR USE OF THE EVALUATION BOARD, INCLUDING BUT NOT LIMITED TO LOST PROFITS, DELAY COSTS, LABOR COSTS OR LOSS OF GOODWILL. ADI’S TOTAL LIABILITY FROM ANY AND ALL CAUSES SHALL BE LIMITED TO THE AMOUNT OF ONE HUNDRED US DOLLARS ($100.00). EXPORT. Customer agrees that it will not directly or indirectly export the Evaluation Board to another country, and that it will comply with all applicable United States federal laws and regulations relating to exports. GOVERNING LAW. This Agreement shall be governed by and construed in accordance with the substantive laws of the Commonwealth of Massachusetts (excluding conflict of law rules). Any legal action regarding this Agreement will be heard in the state or federal courts having jurisdiction in Suffolk County, Massachusetts, and Customer hereby submits to the personal jurisdiction and venue of such courts. The United Nations Convention on Contracts for the International Sale of Goods shall not apply to this Agreement and is expressly disclaimed.
