Evaluating the AD7327/AD7328

FEATURES
Full-featured evaluation board for the AD7327/AD7328
PC control in conjunction with the system demonstration platform (EVAL-SDP-CB1Z)
PC software for control and data analysis (time and frequency domain)
Standalone capability

EVAL-AD7327SDZ/EVAL-AD7328SDZ KIT CONTENTS
EVAL-AD7327SDZ/EVAL-AD7328SDZ evaluation board
Evaluation software CD for the AD7327/AD7328
9 V mains power supply adapter

ADDITIONAL EQUIPMENT NEEDED
System demonstration platform (EVAL-SDP-CB1Z)
Precision analog signal source
SMB cables
USB cables

EVALUATION BOARD DESCRIPTION
The EVAL-AD7327SDZ/EVAL-AD7328SDZ is a full-featured evaluation board, designed to allow the user to easily evaluate all features of the AD7327/AD7328. The evaluation board can be controlled via the SDP connector (J2). The EVAL-SDP-CB1Z board allows the evaluation board to be controlled via the USB port of a PC using the AD7327/AD7328 evaluation software.

The EVAL-AD7327SDZ/EVAL-AD7328SDZ generates all required power supplies on-board and supplies power to the EVAL-SDP-CB1Z controller board.

On-board components include the following:
- AD8597: ultralow noise op amp
- ADP1613: step-up PWM dc-to-dc switching converter
- ADP3303-5: high accuracy anyCAP® 200 mA low dropout linear regulator
- ADP2301: 1.2 A, 20 V, 1.4 MHz nonsynchronous step-down switching regulator
- ADM1185: quad voltage monitor and sequencer
- ADP190: logic controlled, high-side power switch
- ADG3308: low voltage, 1.15 V to 5.5 V, 8-channel bidirectional logic level translator
- AD780: 5 V/3.0 V ultrahigh precision band gap voltage reference

Various link options are described in the Evaluation Board Hardware section.

EVAL-AD7327SDZ/EVAL-AD7328SDZ QUICK START GUIDE

RECOMMENDED QUICK START GUIDE

To install the software, do the following:

1. Install the AD7327/AD7328 software from the enclosed CD. When installing the software, ensure that the EVAL-SDP-CB1Z board is disconnected from the USB port of the PC. After installation, restart the PC.

2. Connect the EVAL-SDP-CB1Z board to the EVAL-AD7327SDZ/EVAL-AD7328SDZ board, as shown in Figure 2.

3. Screw the EVAL-SDP-CB1Z board to the EVAL-AD7327SDZ/EVAL-AD7328SDZ board together with the enclosed nylon screw-nut set to ensure that the boards connect firmly together.

4. Connect the 9 V power supply adapter included in the kit to the J702 connector on the EVAL-AD7327SDZ/EVAL-AD7328SDZ board.

5. Connect the EVAL-SDP-CB1Z board to the PC via the USB cable. For Windows® XP, searching for the EVAL-SDP-CB1Z drivers may be needed. If prompted by the operating system, choose to automatically search for the drivers for the EVAL-SDP-CB1Z board.

6. Launch the AD7327/AD7328 software from the Analog Devices, Inc., subfolder in the All Programs menu.

Figure 2. Setting Up the EVAL-AD7327SDZ/EVAL-AD7328SDZ
EVALUATION BOARD HARDWARE

AD7327 DEVICE DESCRIPTION

The AD7327 is an 8-channel, 12-bit plus sign, successive approximation analog-to-digital converter (ADC) designed on the industrial CMOS (iCMOS) process. iCMOS is a process that combines high voltage silicon with submicron CMOS and complementary bipolar technologies. It enables the development of a wide range of high performance analog ICs capable of 33 V operation in a footprint that no previous generation of high voltage parts could achieve. Unlike analog ICs using conventional CMOS processes, iCMOS components can accept bipolar input signals while providing increased performance, dramatically reduced power consumption, and reduced package size.

The AD7327 can accept true bipolar analog input signals. The AD7327 has four software-selectable input ranges: ±10 V, ±5 V, ±2.5 V, and 0 V to +10 V. Each analog input channel can be independently programmed to one of the four input ranges. The analog input channels on the AD7327 can be programmed to be single-ended, true differential, or pseudo differential.

The ADC contains a 2.5 V internal reference. The AD7327 also allows external reference operation. If a 3 V reference is applied to the REFIN/OUT pin, the AD7327 can accept a true bipolar ±12 V analog input. Minimum ±12 V VDD and VSS supplies are required for the ±12 V input range. The ADC has a high speed serial interface that can operate at throughput rates up to 500 kSPS.

AD7328 DEVICE DESCRIPTION

The AD7328 is an 8-channel, 12-bit plus sign, successive approximation ADC designed on the industrial CMOS (iCMOS) process. iCMOS is a process that combines high voltage silicon with submicron CMOS and complementary bipolar technologies. It enables the development of a wide range of high performance analog ICs capable of 33 V operation in a footprint that no previous generation of high voltage parts could achieve. Unlike analog ICs using conventional CMOS processes, iCMOS components can accept bipolar input signals while providing increased performance, dramatically reduced power consumption, and reduced package size.

The AD7328 can accept true bipolar analog input signals. The AD7328 has four software-selectable input ranges: ±10 V, ±5 V, ±2.5 V, and 0 V to +10 V. Each analog input channel can be independently programmed to one of the four input ranges. The analog input channels on the AD7328 can be programmed to be single-ended, true differential, or pseudo differential.

The ADC contains a 2.5 V internal reference. The AD7328 also allows for external reference operation. If a 3 V reference is applied to the REFIN/OUT pin, the AD7328 can accept a true bipolar ±12 V analog input. Minimum ±12 V VDD and VSS supplies are required for the ±12 V input range. The ADC has a high speed serial interface that can operate at throughput rates up to 1 MSPS.

Complete specifications for the AD7327/AD7328 are provided in the AD7327/AD7328 data sheet, available from Analog Devices, which should be consulted in conjunction with this user guide when using the EVAL-AD7327SDZ/EVAL-AD7328SDZ evaluation board.

HARDWARE LINK OPTIONS

Before using the evaluation board, the required operating setup has 23 link options that must be set. The functions of these options are outlined in Table 1. Table 1 lists the position in which all the links are set when the evaluation board is packaged. Before using the evaluation board, set the jumper and solder link (LKx) options correctly to select the appropriate operating setup. The default link positions are listed in Table 2, and the functions of these options are outlined in Table 1.

**POWER SUPPLIES**

Take care before applying power and signals to the evaluation board to ensure that all link positions are as required by the operating mode.

When using the EVAL-AD7327SDZ/EVAL-AD7328SDZ in conjunction with the EVAL-SDP-CB1Z board, connect the ac transformer to the J702 connector. VCC, VDD, VSS, and VDRIVE are generated on board.

Each supply is decoupled on the EVAL-AD7327SDZ/EVAL-AD7328SDZ using the 10 µF and 0.1 µF capacitors. A single ground plane is used on this board to minimize the effect of high frequency noise interference.

1 When this is supplied, all other power supplies are available on-board. If this supply is not used, all other supplies must be sourced from an external source.
SERIAL INTERFACE
The AD7327/AD7328 uses a high speed serial interface that allows sampling rates up to 500 kSPS for the AD7327 and 1 MSPS for the AD7328. For details on the operation of the serial bus, refer to the AD7327 data sheet and the AD7328 data sheet.

The EVAL-AD7327SDZ/EVAL-AD7328SDZ communicates with the EVAL-SDP-CB1Z board using level shifters. The EVAL-SDP-CB1Z operates at a 3.3 V logic level. The level shifters allow the VDRIVE voltages to exceed 3.3 V and be used without damaging the SDP interface.

Details of the serial interface can be found in the AD7327 data sheet and the AD7328 data sheet.

ANALOG INPUTS
The analog inputs on the EVAL-AD7327SDZ/EVAL-AD7328SDZ are filtered and buffered by the AD8597 ultralow distortion, ultra-low noise op amp. The EVAL-AD7327SDZ/EVAL-AD7328SDZ is configured for single-ended input mode.

The A0 and A1 inputs allow a signal to be connected to the board via the SMB connectors. Alternatively, all signals can be connected via Header J1.

For performance evaluation, using the SMB connections is recommended for the best signal quality on the A0 and A1 inputs. Each analog input to the EVAL-AD7327SDZ/EVAL-AD7328SDZ allows a 51 Ω load to be placed on the input, if required. LK1 to LK8 are placed to connect the inputs to the 51 Ω loads.

REFERENCE OPTIONS
The reference source can be from the AD7327/AD7328 REFIN/OUT pin or from an AD780, 5 V/3.0 V, ultrahigh, precision band gap voltage reference (U12). An external reference voltage may also be applied to Pin 2 of J7.

EVAL-AD7327SDZ/EVAL-AD7328SDZ BASIC HARDWARE SETUP
The AD7327/AD7328 evaluation board connects to the SDP board (EVAL-SDP-CB1Z). The EVAL-SDP-CB1Z board is the controller board, which is the communication link between the PC and the main evaluation board. Figure 2 shows a photograph of the connections made between the AD7327/AD7328 daughter board and the EVAL-SDP-CB1Z board.

Before connecting power, connect the EVAL-AD7327SDZ/EVAL-AD7328SDZ board to Connector A or Connector B on the EVAL-SDP-CB1Z board. Use the nylon screws included in the EVAL-AD7327SDZ/EVAL-AD7328SDZ evaluation kit and to ensure the EVAL-AD7327SDZ/EVAL-AD7328SDZ board and the EVAL-SDP-CB1Z board are connected firmly together.

When the EVAL-AD7327SDZ/EVAL-AD7328SDZ board and the EVAL-SDP-CB1Z board are connected securely, connect the power supplies on the EVAL-AD7327SDZ/EVAL-AD7328SDZ board. The EVAL-AD7327SDZ/EVAL-AD7328SDZ requires an external power supply, which is included in the evaluation board kit. Connect this power supply to the J702 connector on the EVAL-AD7327SDZ/EVAL-AD7328SDZ board. Alternatively, a bench power supply can be used to power the EVAL-AD7327SDZ/EVAL-AD7328SDZ via J8. Further details on the required power supplies connections and options are detailed in Table 4.

Before connecting the EVAL-SDP-CB1Z board to a PC, ensure that the AD7327/AD7328 software has been installed from the enclosed CD. The full software installation procedure is detailed in the Evaluation Board Software section.

Finally, connect the EVAL-SDP-CB1Z board to the PC via the USB cable enclosed in the EVAL-SDP-CB1Z kit. If using the Windows XP® platform, the EVAL-SDP-CB1Z drivers may need to be searched for. If prompted by the operating system, choose to automatically search for the drivers for the EVAL-SDP-CB1Z board.
EVALUATION BOARD SOFTWARE

SOFTWARE INSTALLATION

The EVAL-AD7327SDZ/EVAL-AD7328SDZ evaluation kit includes software on a CD. Click the setup.exe file from the CD to run the install. The default location for the software is the following: C:\Program Files\Analog Devices\AD7327_28.

Install the evaluation software before connecting the evaluation board and the EVAL-SDP-CB1Z board to the USB port of the PC to ensure that the evaluation system is correctly recognized when connected to the PC.

There are two parts to the installation

- AD7327/AD7328 evaluation board software install
- EVAL-SDP-CB1Z SDP board drivers install

Figure 3 to Figure 7 show the separate stages of the AD7327/AD7328 evaluation software. Figure 8 to Figure 12 show the separate steps to install the EVAL-SDP-CB1Z drivers. Proceed through all of the installation steps allowing the software and drivers to be placed in the appropriate locations. Only after the software and drivers have been installed should the EVAL-SDP-CB1Z board be connected to the PC.
After installation from the CD is complete, connect the EVAL-AD7327SDZ/EVAL-AD7328SDZ board to the EVAL-SDP-CB1Z board as described in the Evaluation Board Hardware section. When the EVAL-SDP-CB1Z board is first plugged in via the USB cable provided, allow the Found New Hardware Wizard to run. Once the drivers are installed, ensure that the board has connected correctly by looking at the Device Manager of the PC. When the EVAL-SDP-CB1Z board appears under ADI Development Tools, the installation is completed.
LAUNCHING THE SOFTWARE

When the EVAL-AD7327SDZ/EVAL-AD7328SDZ and EVAL-SDP-CB1Z are correctly connected to the PC, the AD7327/AD7328 software can be launched.

To launch the software, complete the following steps:

1. From the Start menu, select Programs/Analog Devices/AD7327/AD7328. The main window of the software then displays.

2. If the AD7327/AD7328 evaluation system is not connected to the USB port via the EVAL-SDP-CB1Z when the software is launched, a connectivity error displays (see Figure 14). Connect the evaluation board to the USB port of the PC, wait a few seconds, click Rescan, and follow the instructions.

SOFTWARE OPERATION

When the software is launched, the panel opens and the software looks for hardware connected to the PC. The software detects the generic attached to the PC and returns this in a user dialog box. The user software panel then launches as shown in Figure 15.

![Figure 14. Connectivity Error Alert](image-url)
DESCRIPTION OF USER SOFTWARE PANEL

The user software panel, as shown in Figure 15, has the following features:

1. **File** menu with the choice of the following:
   a. **Load data**: load previously captured data in .tsv (tab separated values) format for analysis
   b. **Save Data as .tsv**: save captured data in .tsv) format for future analysis
   c. **Print Front Panel Picture**: use to print the front panel to the default printer.
   d. **Save Picture**: use to save the current screen capture
   e. **EXIT**

2. Use this drop-down menu to select the generic, AD7327 or AD7328.

3. **Sampling Rate**: The default sampling frequency matches the maximum sample rate of the ADC selected from the drop-down menu. User can adjust the sampling frequency; however, there are limitations around the sample frequency, where unusable sample frequencies are input, and the software automatically adjusts the sample frequency accordingly. Units can be entered such as 10k for 10,000 Hz. As the maximum sample frequency possible is device dependent, with some of the ADCs capable of operating up to 250 kSPS, while others can run to 1.3 MSPS, the software matches the particular ADC ability. If the user enters a value larger than the ability of the existing device, the software indicates this and reverts to the maximum sample frequency.

4. **Sample**: to perform a single capture.

5. **Continuous**: to perform a continuous capture from the ADC. Press a second time to stop sampling.

6. Select the number of samples (# Samples) to analyze.

7. There are four tabs available displaying the data in different formats, these are listed here and described in more detail in the Data Capture/WaveForm Tab, AC Testing—Data Capture/Histogram Tab, DC Testing—Data Capture/Histogram Tab, AC Testing—Data Capture/FFT Tab, and Data Capture/Summary Tab sections.
   a. **Waveform**
   b. **Histogram**
   c. **FFT**
   d. **Summary**

Figure 15. User Software Panel, Setup Screen
8. **EXIT** button. Use this button to exit the software. Alternatively, go to **File/Exit**.

9. Channel display buttons. Use these to display multiple channel reads on the display. For FFT analysis, select only one channel.

10. Registers (**Control Register**, **Sequence Register**, **Range Register 1**, and **Range Register 2**). Use these buttons to access the register settings dialog boxes. See the Register Controls section for more details.

Within any of the chart panels, the following tools allow user control of the different chart displays.

- **Arrow** is used for controlling the cursor, if present.
- **Magnifying Glass** is used for zooming in and out.
- **Chain** is used for panning.

Click **Save Plot** to save plots.

**REGISTER CONTROLS**

There are four registers used to control the operations of the AD7327/AD7328. For detailed settings of these registers, refer to the relevant data sheet.

The **Control Register** sets up the addressing, modes, and power management, as well as setting the sequence, coding, and reference source (see Figure 16).

![Figure 16. Control Register Dialog Box](image)

The **Sequence Register** selects which channels are included in the channel sequencing (see Figure 17).

![Figure 17. Sequence Register Dialog Box](image)

The **Range Register 1** and **Range Register 2** allow the range of each channel to be individually selected (Figure 18 and Figure 19).

![Figure 18. Range Register1 Dialog Box](image)

![Figure 19. Range Register2 Dialog Box](image)
Figure 20 illustrates the Data Capture/Waveform tab. The input signal here is a 50 kHz sine wave.

Number 1 in Figure 20 shows that the waveform analysis reports back the amplitudes recorded from the captured signal in addition to the frequency of the signal tone (see Figure 20).

DATA CAPTURE/WAVEFORM TAB

Figure 20 illustrates the Data Capture/Waveform tab. The input signal here is a 50 kHz sine wave.
AC TESTING—DATA CAPTURE/HISTOGRAM TAB

Figure 21 shows the Data Capture/Histogram tab. This tab allows the user to test the ADC for the code distribution for ac input and computes the mean and standard deviation, or transition noise of the converter, and displays the results.

Raw data is captured and then passed to the PC for statistical computations. To perform a histogram test, select the Histogram tab and click Sample.

An ac histogram needs a quality signal source applied to the input of the SK1/SK3 connectors. Figure 21 shows the histogram for a 50 kHz sine wave applied to the ADC input and the results calculated.

Number 1 in Figure 21 illustrates the different measured values for the data captured.

DC TESTING—DATA CAPTURE/HISTOGRAM TAB

More commonly, the histogram is used for dc testing, where the ADC is tested for the code distribution for dc input and computes the mean and standard deviation, or transition noise of the converter, and displays the results. Raw data is captured and passed to the PC for statistical computations. To perform a histogram test, select the Histogram tab click Sample.

A histogram test can be performed without an external source because the evaluation board has a buffered $V_{REF}/2$ source at the ADC input. To test other dc values, apply a source to the J3 and J4 inputs. To make the dc source noise compatible with that of the ADC, it may be required to filter the signal.
AC TESTING—DATA CAPTURE/FFT TAB

Figure 22 shows the Data Capture/FFT tab. This tests the traditional ac characteristics of the converter and displays a Fast Fourier Transform (FFT) of the results. As in the histogram test, raw data is captured and passed to the PC, where the FFT is performed displaying the signal-to-noise ratio (SNR), signal-to-noise-and-distortion ratio (SINAD), total harmonic distortion (THD), and spurious-free dynamic range (SFDR). To perform an ac test, apply a sinusoidal signal to the evaluation board at the SMB inputs, J4 and J6. Low distortion, better than 115 dB, is required to allow true evaluation of the part. One possibility is to filter the input signal from the ac source. There is no suggested band-pass filter; however, take consideration in the choice. Furthermore, if using a low frequency, band-pass filter when the full-scale input range is more than a few volts peak-to-peak, use the on-board amplifiers to amplify the signal, thus preventing the filter from distorting the input signal.

Figure 22 displays the results of the captured data.
1. Shows the input signal information
2. Displays the fundamental frequency (Fund) and amplitude in addition to the second (2nd) to fifth (5th) harmonics.
3. Displays the performance data: SNR, THD, SINAD, Peak Spurious, Pk Noise Freq, and Bin.
**DATA CAPTURE/SUMMARY TAB**

Figure 23 shows the Data Capture/Summary tab. It captures all the display information and provides it in one panel with a synopsis of the information, including key performance parameters, such as SNR and THD.
SAVE FILE
The software can save the current captured data for later analysis to a .tsv file (see Figure 24). Window users are prompted to save to an appropriate folder location.

![Figure 24. Save File Dialog Box (Choose file to write.)](image)

LOAD FILE
In the Choose file to read. window, users are prompted to load the file (see Figure 25). User may have to navigate to find these example files. The default location for the example files is: C:\Program Files\Analog Devices\AD7327_28\examples.

EVALUATION BOARD SCHEMATICS AND ARTWORK

Figure 26. Schematic Page 1
Board ID EEPROM (24LC32) must be on I2C bus 0, I2C bus 1 is common across both connectors on SDP - Pull up resistors required

BMODE1: Pull up with a 10K resistor to set SDP to boot from a SPI FLASH on the daughter board

Main I2C bus (Connected to blackfin TWI - Pull up resistors not required)

VIN: Use this pin to power the SDP requires 5V 200mA

VIO: USE to set IO voltage max draw 20mA

ESD Caution

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Legal Terms and Conditions

By using the evaluation board discussed herein (together with any tools, components documentation or support materials, the "Evaluation Board"), you are agreeing to be bound by the terms and conditions set forth below ("Agreement") unless you have purchased the Evaluation Board, in which case the Analog Devices Standard Terms and Conditions of Sale shall govern. Do not use the Evaluation Board until you have read and agreed to the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. Do not use the Evaluation Board for any purpose other than evaluation.

Subject to the terms and conditions of the Agreement, ADI hereby grants to Customer a free, limited, personal, temporary, non-exclusive, non-sublicensable, non-transferable license to use the Evaluation Board FOR EVALUATION PURPOSES ONLY. Customer understands and agrees that the Evaluation Board is provided for the sole and exclusive purpose referenced above, and agrees not to use the Evaluation Board for any other purpose. Furthermore, the license granted is expressly made subject to the following additional limitations: Customer shall not (i) rent, lease, display, sell, transfer, assign, sublicense, or distribute the Evaluation Board; and (ii) permit any Third Party to access the Evaluation Board. As used herein, the term "Third Party" includes any entity other than ADI, Customer, their employees, affiliates and in-house consultants. The Evaluation Board is NOT sold to Customer; all rights not expressly granted herein, including ownership of the Evaluation Board, are reserved by ADI. CONFIDENTIALITY. This Agreement and the Evaluation Board shall all be considered the confidential and proprietary information of ADI. Customer may not disclose or transfer any portion of the Evaluation Board to any other party for any reason. Upon discontinuation of use of the Evaluation Board or termination of this Agreement, Customer agrees to promptly return the Evaluation Board to ADI. ADDITIONAL RESTRICTIONS. Customer may not disassemble, decompile or reverse engineer chips on the Evaluation Board. Customer shall inform ADI of any occurred damages or any modifications or alterations it makes to the Evaluation Board, including but not limited to soldering or any other activity that affects the material content of the Evaluation Board. Modifications to the Evaluation Board must comply with applicable law, including but not limited to the RoHS Directive. TERMINATION. ADI may terminate this Agreement at any time upon giving written notice to Customer. Customer agrees to return to ADI the Evaluation Board at that time. LIMITATION OF LIABILITY. THE EVALUATION BOARD PROVIDED HEREUNDER IS PROVIDED "AS IS" AND ADI MAKES NO WARRANTIES OR REPRESENTATIONS OF ANY KIND WITH RESPECT TO IT. ADI SPECIFICALLY DISCLAIMS ANY REPRESENTATIONS, ENDORSEMENTS, GUARANTEES, OR WARRANTIES, EXPRESS OR IMPLIED, RELATED TO THE EVALUATION BOARD INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTY OF MERCHANTABILITY, TITLE, FITNESS FOR A PARTICULAR PURPOSE OR NONINFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS. IN NO EVENT WILL ADI AND ITS LICENSORS BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES RESULTING FROM CUSTOMER'S POSSESSION OR USE OF THE EVALUATION BOARD, INCLUDING BUT NOT LIMITED TO LOST PROFITS, DELAY COSTS, LABOR COSTS OR LOSS OF GOODWILL. ADI'S TOTAL LIABILITY FROM ANY AND ALL CAUSES SHALL BE LIMITED TO THE AMOUNT OF ONE HUNDRED US DOLLARS ($100.00). Export. Customer agrees that it will not directly or indirectly export the Evaluation Board to another country, and that it will comply with all applicable United States federal laws and regulations relating to exports. GOVERNING LAW. This Agreement shall be governed by and construed in accordance with the substantive laws of the Commonwealth of Massachusetts (excluding conflict of law rules). Any legal action regarding this Agreement will be heard in the state or federal courts having jurisdiction in Suffolk County, Massachusetts, and Customer hereby submits to the personal jurisdiction and venue of such courts. The United Nations Convention on Contracts for the International Sale of Goods shall not apply to this Agreement and is expressly disclaimed.
