Evaluation Board for Differential Amplifiers
Offered in 8-Lead SOIC Packages

**FEATURES**

- Flexible board layout allows for various circuit configurations
- Accommodates the ADA4940-1 and the AD813x family of differential amplifiers in 8-lead SOIC packages
- Enables quick breadboarding/prototyping
- Edge-mounted SMA connector provisions
- Easy connection to test equipment and other circuits
- RoHS compliant

**GENERAL DESCRIPTION**

The Analog Devices, Inc., 8-lead SOIC evaluation board for differential drivers is designed to help users evaluate differential drivers offered in 8-lead standard small outline (SOIC) packages. The 8-lead SOIC differential driver evaluation board makes it easy for designers to obtain quick performance results for their specific differential driver application circuits.

The 8-lead SOIC evaluation board is a bare board (that is, no components are soldered to the board) that enables users to quickly prototype a variety of differential driver circuits, thereby minimizing risk and reducing time to market. The board layout is very flexible and allows for many circuit configurations, including traditional four-resistor circuits, circuits with two different feedback loops, filters, and many others. Most resistors and capacitors use 1206, 0402, 0508, and 0603 packages.

Figure 1 shows the component side of the bare evaluation board, and Figure 2 shows the circuit side of the evaluation board.

Because this universal evaluation board can be used with many Analog Devices differential amplifiers in 8-lead SOIC packages, the evaluation board label does not contain specific part numbers. The board accommodates the ADA4940-1, as well as many members of the AD813x family of differential amplifiers (see the Related Links section). The data sheets for these devices should be consulted in conjunction with this evaluation board user guide.

EVALUATION BOARD HARDWARE

POWER SUPPLIES

Power is applied to the evaluation board through the TVCC and TVEE test points (see Figure 3). The board accommodates single or dual supplies. For single-supply operation, connect the negative supply to the ground plane.

It is very important that the power supply pins of the device under test (DUT) have broadband decoupling circuitry. The board layout facilitates this with footprints for 0508 ceramic capacitors (CVCC2 and CVEE2) on each supply, as well as 0402 ceramic capacitors (CVCC1 and CVEE1). Bulk decoupling is provided by CVCC3 and CVEE3; 10 µF tantalum capacitors are recommended.

FEEDBACK NETWORKS AND INPUT/OUTPUT TERMINATIONS

Resistors RGN and RFN comprise the negative resistive feedback loop, and Resistors RGP and RFP comprise the positive feedback loop (see Figure 3). To minimize summing node capacitances, the ground plane under and around Pin 1 and Pin 8 of the DUT and the copper that connects to them have been removed.

Resistors RTN and RTP are included as input termination resistors for applications that have single-ended inputs.

VOCM INPUT

An external voltage can be applied to the VOCM pin via the TVOCM test point (referenced to the ground plane of the board). In ADC driver applications, it is convenient to apply the ADC dc reference voltage output directly. The CVOM component position can be used for both resistors and capacitors. A 0.1 µF capacitor is used in normal applications to provide bypassing for the dc voltage applied to the VOCM pin.

It is also possible to drive the VOCM input from an external ac source. In this case, omit CVOM, or reduce it to a value that allows the desired signal to be passed.

COMMON-MODE VOLTAGE

The internal common-mode feedback loop used in the differential drivers forces the output common-mode voltage to be equal to the voltage applied to the VOCM input, thereby providing excellent output balance.

SMA INPUT/OUTPUT CONNECTORS

The inputs and outputs have edge-mounted SMA connectors for convenient connection to coaxial cables. The recommended connector is Part No. 142-0701-801 from Johnson Components, or equivalent.

NOTES

ESD Caution
ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Legal Terms and Conditions
By using the evaluation board discussed herein (together with any tools, components documentation or support materials, the “Evaluation Board”), you are agreeing to be bound by the terms and conditions set forth below (“Agreement”) unless you have purchased the Evaluation Board, in which case the Analog Devices Standard Terms and Conditions of Sale shall govern. Do not use the Evaluation Board until you have read and agreed to the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. Do not use the Evaluation Board until you have read and agreed to the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement.
