

QUICK START GUIDE FOR DEMONSTRATION CIRCUIT 1215

5A, 15V, MONOLITHIC SYNCHRONOUS STEP-DOWN REGULATOR

LTC3605

DESCRIPTION

Demonstration circuit 1215 is a step-down converter, using the LTC3605 monolithic synchronous buck regulator. The DC1215A has a maximum input voltage 15V, and is capable of delivering up to 5A of output current at a minimum input voltage of 4V. The output voltage of the DC1215A can be set as low as 0.6V, the reference voltage of the LTC3605. At low load currents, the DC1215A operates in discontinuous mode, and during shutdown, it consumes less than 10 μ A of quiescent current. In continuous mode operation, the DC1215A is a high efficiency circuit - over 80%. The LTC3605 has phase lock circuits, allowing high current multi-phase operation of several DC1215As in parallel.

The DC1215A can also track another voltage with the LTC3605 track function. Because of the high switching frequency of the LTC3605, which is programmable up to 4 MHz, the DC1215A uses low profile surface mount components. All these features make the DC1215A an ideal circuit for use in industrial applications and distributed power systems. Gerber files for this circuit are available. Call the LTC Factory.

Design files for this circuit are available. Call the LTC Factory.

Table 1. Performance Summary ($T_A = 25^\circ\text{C}$)

| PARAMETER | CONDITIONS | VALUE |
|-------------------------------------|---|---|
| Minimum Input Voltage | | 4V |
| Maximum Input Voltage | | 15V |
| Run/Shutdown | | GND = Shutdown |
| | | V_{IN} = Run |
| Output Voltage V_{OUT} Regulation | $V_{IN} = 4\text{V to }15\text{V}, I_{OUT} = 0\text{A to }5\text{A}$ | $2.5\text{V} \pm 4\%$ (2.4V – 2.6V) |
| | $V_{IN} = 4.5\text{V to }15\text{V}, I_{OUT} = 0\text{A to }5\text{A}$ | $3.3\text{V} \pm 4\%$ (3.168V – 3.432V) |
| | $V_{IN} = 6.4\text{V to }15\text{V}, I_{OUT} = 0\text{A to }5\text{A}$ | $5\text{V} \pm 4\%$ (4.8V – 5.2V) |
| Typical Output Ripple V_{OUT} | $V_{IN} = 12\text{V}, V_{OUT} = 2.5\text{V}, I_{OUT} = 2.5\text{A}$ (20 MHz BW) | $< 40\text{mV}_{P-P}$ |
| Discontinuous Mode | $V_{IN} = 12\text{V}, V_{OUT} = 2.5\text{V}$ | $< 2\text{A}$ |
| Nominal Switching Frequency | $R_T = 162\text{k}$ | 1 MHz |

QUICK START PROCEDURE

Demonstration Circuit 1215 is easy to set up to evaluate the performance of the LTC3605. For proper measurement equipment configuration, set up the circuit according to the diagram in **Figure 1**. Before proceeding to test, insert shunts into the OFF position of the RUN header JP7, the forced continuous mode position (FCM) of the MODE header JP6, the 2 phase position of the PHMODE header JP5, and the 3.3V output voltage header, JP2.

When measuring the input or output voltage ripple, care must be taken to avoid a long ground lead on the oscilloscope probe. Measure the input or output voltage ripple by touching the probe tip directly across the Vin or Vout and GND terminals. See **Figure 2** for proper scope probe measurement technique.

With the DC1215 set up according to the proper measurement configuration and equipment in **Figure 1**, apply 6.3V at Vin (Do not hot-plug Vin or increase Vin over the rated maximum supply voltage of 15V, or the part may be damaged.). Measure Vout; it should read 0V. Turn on the circuit by inserting the shunt in header JP7 into the ON position. The output voltage should be regulating. Measure Vout - it should measure 2.5V +/- 2% (2.45V to 2.55V).

Vary the input voltage from 4V to 15V and adjust the load current from 0 to 5A. Vout should read 2.5V +/- 4% (2.4V to 2.6V).

Adjust the output current to 5A. Measure the output ripple voltage; it will measure less than 40 mVAC.

Observe the voltage waveform at the switch node (pins 16 thru 19). Verify the switching frequency is

between 800 kHz and 1.2 MHz ($T = 1.25 \mu\text{s}$ and $0.833 \mu\text{s}$), and that the switch node waveform is rectangular in shape.

Change the JP6 shunt from forced continuous mode to discontinuous mode (DCM). Also set the input voltage to 12V and the output current to any current less than 1.5A. Observe the discontinuous mode of operation at the switch node, and measure the output ripple voltage. It should measure less than 150 mV.

Insert the JP7 shunt into the OFF position and move the shunt in the 2.5V output JP1 header into any of the two remaining output voltage option headers: 3.3V (JP2) or 5V (JP3). Just as in the 2.5V Vout test, the output voltage should read Vout +/- 2% tolerance under static line and load conditions and +/- 1% tolerance under dynamic line and load conditions (+/- 2% total). Also, the circuit operation in discontinuous mode will be the same.

When finished, turn off the circuit by inserting the shunt in header JP7 into the OFF position.

Low Output Voltage Configuration

For applications with output voltages less than 2V, the inductor value of 1 μH on the DC1215 should be changed to 0.33 μH . This is required so that the inductor ripple current ramp has a large enough slope for the current comparator can distinguish it from noise voltages.
